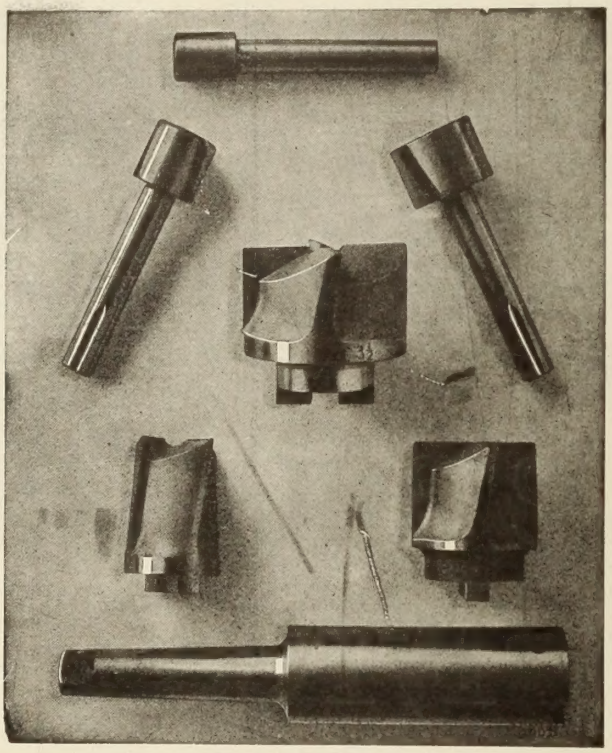
MISCELLANEOUS SHOP TOOLS

SMALL TOOLS

Equip Your Tool Room With

PRATT & WHITNEY

Interchangeable Cutter Counterbores



and get the right combination at once.

HOLDER, CUTTER and GUIDE

With this combination you can immediately make the right combination for every counterboring job.

HOLDERS

End of holder is milled to receive the driving lug of the cutter, and there is also a hole and set screw to accommodate the shank of the guides.

GUIDES

Are of hardened tool steel. They are held in place by means of a set screw in the holder engaging a V-slot in the shank of the guide.

CUTTERS

Can be furnished of either carbon or high-speed steel.

The shank of the guide passes through the hole in the cutter and the shoulder between the guide and its shank keeps the cutter in place. Cutters can be sharpened on the face, and the guide is simply pushed further in the hole after grinding.

Holders, Cutters and Guides are furnished in a wide range of sizes.

PROMPT SERVICE

is assured at our nearest store where P. & W. Small Tools are carried in stock. Place your order there to-day.

Vol. XXII. TORONTO, JULY 3, 1919. No. 1

Competition and Volume

THE big four of thirty years ago in the packing industry is not the same big four of to-day. A new firm took the place of one of the old. Yet at the time the big four were supposed to be a monopoly.

The Steel Corporation, the Chain Store, The American Tobacco Company, The Standard Oil Company, all were supposed to be dangerous because combination would allow them to advance prices, make big profits and throttle competition. The dire results predicted never followed. In each field competitors have profited by volume of trade, and a small profit has proved better business economics than small volume and big margin.

In this transformation of business, advertising has played a most important part. Increased demand increases volume and lowers the unit cost. A new firm with vision, faith and capital, always has a look in.

Competition has been theoretically killed many a time in the fears of some people by monopoly. Nothing can kill it in practice except state socialism or the new and better theory of co-operative advertising and lowering the unit cost.—"Printers' Ink."

Canadian Machinery and Manufacturing News, July 3rd, 1919. Vol. 22, No. 1. Published weekly at 143-153 University Ave., Toronto, Canada. Subscription price in Canada, $3.00: United States, $3.50. Entered as second-class matter at the Post Office Department, Ottawa, Canada. Entered as second-class matter July 1, 1912, at the Post Office at Buffalo, under the act of March 3rd, 1879.

BETTS

16 Years of Faithful Service

The photograph below, taken in our own shops, shows a 22-ton cross planer bed casting being finish-planed on a Betts 120 x 72″ Planer. The depth of cut on roughing was ¾″ to 1½″, ⅛″ feed at a cutting speed of 28′ per minute.

This Betts Planer has been in active service 16 years, part of the time on 24-hour duty and continues to perform accurately and faithfully on a wide range of duties. Long life and faithful service are characteristic of all Betts tools because they are built to render service—not to sell at a price.

To avoid regrets—select a Betts. Send for detailed information concerning any or all Betts tools.

A Modern Plant

You expect a good product from an up-to-date plant with the best of equipment. The plant of the Canadian Ingersoll-Rand Company at Sherbrooke is one of the best equipped in Canada. (See "Canadian Machinery" for May 8). The foundry provides good castings, the machine-shops are of modern construction with modern machine-tools, the heat treating department is subject to very rigid rules, and the inspection system is particularly thorough.

ELECTRITE

High Speed Steel

SEVERAL factors combine to make this high-speed steel a triumph of the steel-maker's art; Electric Furnaces — entirely infallible, automatically regulated, delivering the same result time after time.

Uranium — This rare element, cousin to Radium, effects a profound change in the texture and quality of the steel.

Added to these, the constant care and skill of years of steel-making experience make the result of each melt a foregone conclusion.

FRANKLIN
DIE-CASTINGS

The Safest Way To Save

A machined part may be perfect mechanically for your purpose—but too expensive.

Franklin Die-Castings have, in many instances, taken the place of machined parts —and not only served as well mechanically, but have the advantage of being absolutely uniform, and also much more easily adapted to quantity production.

Twenty-seven years' experience in the matter of supplying Franklin Die-Castings gives our engineers exceptional judgment in their application.

Booklet "C" will tell you interesting data. It is furnished on request.

Send a sample, or blue print of machined parts and we will furnish special report. Or, better still, let us send an engineer to consult with you.

ANGULAR GRIT

Saves Labor Saves Time Saves Costs

One ton of Angular Grit equals carloads of sand

Quicker and Better

ANGULAR GRIT offers you the most advanced and economical method of cleaning castings, etc. Its angular and irregular cutting points clean raw castings and forgings more thoroughly and with greater speed than either sand or shot.

ANGULAR GRIT dispenses with sand bins and sand dryers, and there is no dust nuisance where it is used.

If you are using sand, think of the labor you can save by adopting ANGULAR GRIT in its place.

Used for all kinds of cleaning operations. Prove its superiority by giving it a trial.

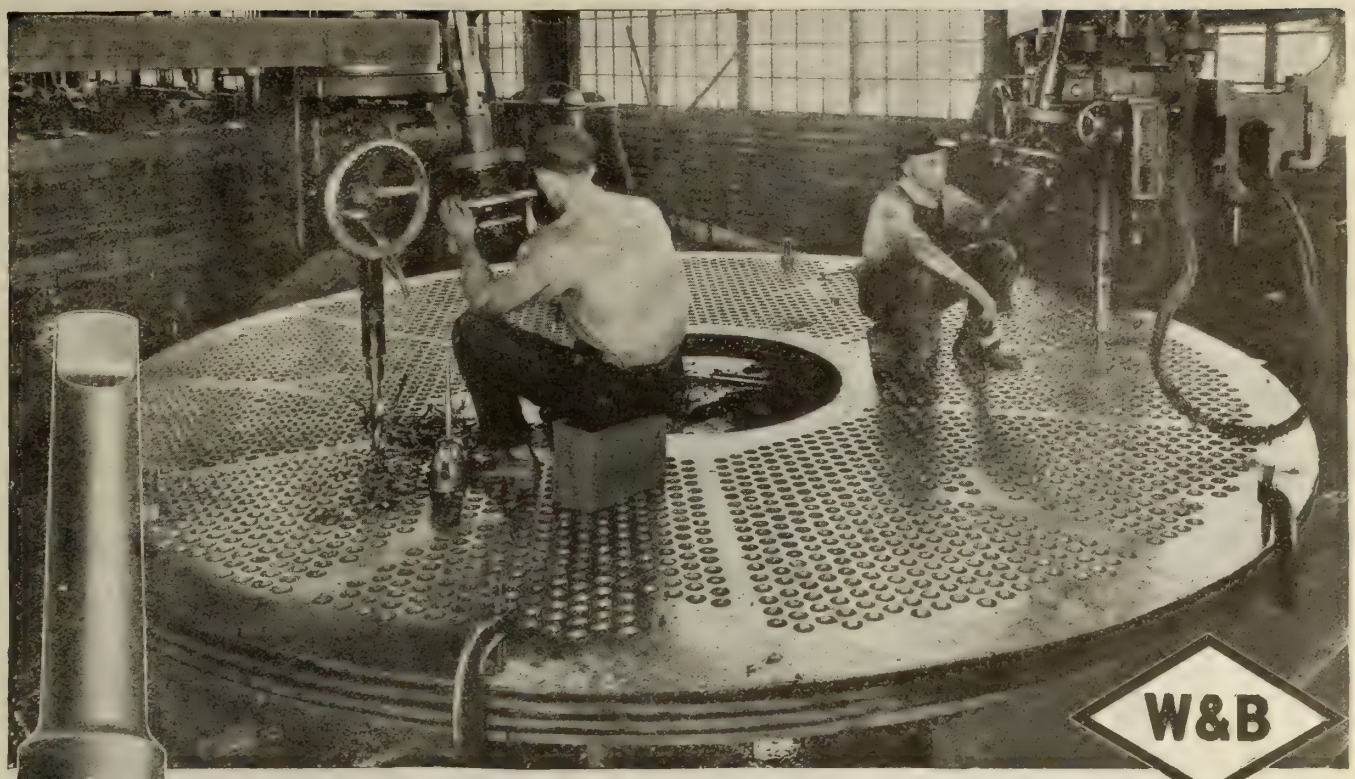
Pittsburgh Crushed Steel Co.

Established 1888

Pittsburgh, Pa., U.S.A.

Canadian Representatives:

Williams and Wilson Ltd., Montreal, P.Q.



The 12,408 holes in these Four Sugar Evaporator plates were drilled 1-47 64" with "W. & B" "Hercules" High Speed Drills and reamed to 1-49 64" with "W & B" High Speed Rose Shell Reamers.

Trade Mark Registered

12,408 Holes—Quick!

THE best drill presses and the most skilled mechanics on earth cannot drill accurate holes without good Twist Drills. Every Drill job requires speed, whether it is a rush order or not. Speed makes profits, conserves machine tool investment, cuts overhead, raises production and increases employees' income. Speed depends on Drill quality.

"W & B" Twist Drills as Speed Factors

Most makers of high grade machine tools invariably use "W & B" Twist Drills to demonstrate hole cutting capacity.

A "W & B" Twist Drill will test the machine where many other drills would break.

"W & B" Twist Drills retain their temper and cutting edge. They do not overheat. Less time is consumed in sharpening and grinding.

Manufacturers in all lines can reach a new production limit by using "W & B" Twist Drills and Reamers in their regular equipment.

"W & B" Twist Drills as Profit Factors

Your investment in machine tool equipment yields the greatest profits when "W & B" Twist Drills and Reamers are used.

"W & B" Twist Drills and Reamers stay on the work more hours, cut more accurately in more kinds of metals, produce more holes, more profits.

"W & B" Carbon and High Speed Twist Drills and Reamers are right for **every industry.** The "W & B" Diamond trademark has international recognition as a mark of achievement, capacity, extreme accuracy, ability to deliver and reasonable cost.

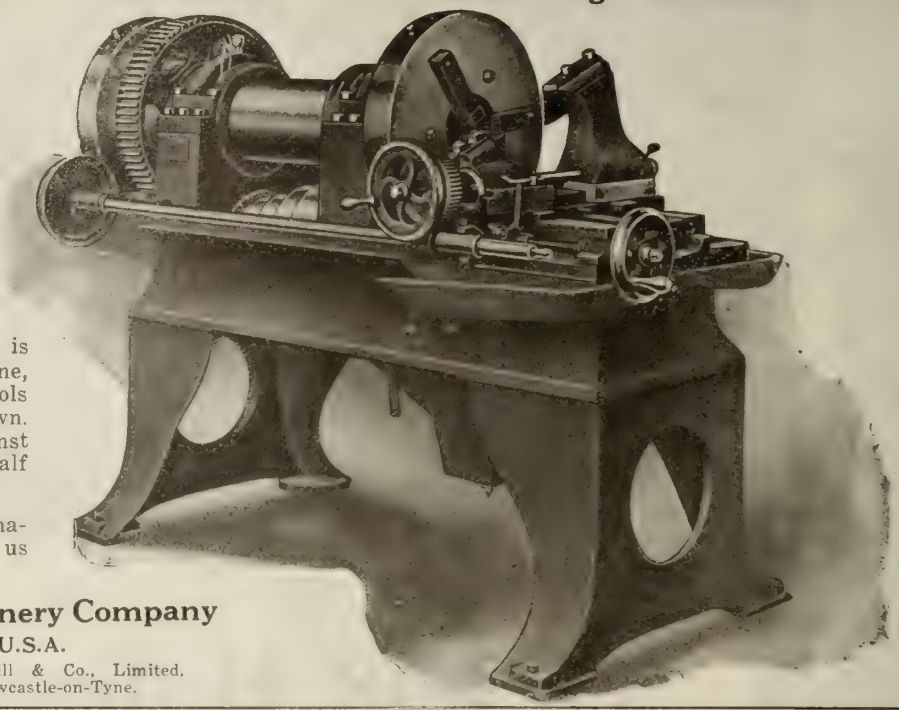
Cut Your Cutting-off Costs in HALF

HURLBUT'S

Patent Cutting-off and Centering Machines



TO say that the Hurlbut, Rogers Cutting-Off and Centering Machine will **double your production** and **cut your costs in half** may seem like a broad claim. But this is just what this machine will do compared with any ordinary machine of its kind.

Hurlbut, Rogers speed and efficiency is easily explained. Instead of only one, it is equipped with two cutting-off tools —one cutting up and the other down. In this way they hold the work against each other and finish a job in just half the time and do twice the work.

You can't afford to be without this machine. It saves real money. Let us tell you more about it. Write!

The Hurlbut, Rogers Machinery Company

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25%; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood pattern-makers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us.

ASK US

GEAR GRINDING

The Heald No. 70 Internal is rapidly becoming known as "the gear grinder." Its unit heads which are easily interchangeable, together with the standard "draw in" collet holds the gears securely and can be readily equipped with special jaws, making it an ideal machine for grinding a hole in all sizes of spur, bevel and worm gears.

At the plant of the Albaugh-Dover Company, Chicago, Illinois, are three Heald Internal Grinding Machines finishing the holes in various types of gears of hardened steel.

They are using the standard draw-in collet regularly furnished with the machine as a fixture with the following results:

No. of Part	Dia.	Length	Limit	Removed	No. per hr.
Differential gear	1⅝″	2½″	.001	.011	13
Miter gear	⅞″	2¼″	.001	.010	20
Bevel gear	1⅜″	3″	.001	.015	12

Send us some samples of the work you expect to grind. Let our Engineering Service Department try them on our machines and recommend the proper wheel, speed and fixtures. Or consult our agents about your needs.

This Time It's Register Frames

The Egry Register Co. of Dayton, Ohio, has been using this particular NATCO Multi-Driller for four and a half years—"no trouble and no repairs."

At the left is one of their register frames—cast iron 3/8 inches thick. The NATCO drills 16 holes—ranging from No. 48 to 5/16 in. diameter at the rate of 216 frames a day.

THE NATCO patented feature—Independent Change of Speed for Each Spindle—makes this possible, for the NATCO is the only machine that will drill, ream, tap, counterbore or spotface different sized holes in one operation with each tool driven at its approximately correct cutting speed.

Let us make you production estimates

CUT YOUR CUTTING COST WITH VICTOR Flexibles

The high cost of tools should emphasize more than ever the importance of quality.

The high cost of hack saw blades ought to drive every hand blade user over to the saw that does not break in ordinary hand work.

VICTOR FLEXIBLE HACK SAW BLADES have exactly the same cutting power as the finest All-Hard on the market, and that they cannot be broken in use except by intentional abuse is an undisputable fact—which will represent a saving from twenty-five percent to thirty-three and one-third percent in breakage alone.

Seventy-five percent of the All-Hard blades used in hand frames break before they are worn out. Watch the All-Hard blades in your own shop and see the enormous amount of breakage—then use VICTOR FLEXIBLES and note the economy.

VICTOR SAW WORKS LTD - HAMILTON, CANADA

"THE RACINE"

High Speed Metal Cutting Machine

Standard the World Over

This is the only machine in the World that has an ABSOLUTELY POSITIVE AUTOMATIC LIFTING DEVICE, a feature secured by patents. Another feature is the rigid saw frame guide. These two assets combine to give long life to the cutting blades and save a lot of money.

"THE RACINE" minimizes wastage, cuts accurately and with great speed. Then they are easy and cheap to operate. These features are appreciated by the best shops everywhere and that's why "THE RACINE" sets the "Standard the World Over." Write for full particulars.

Use "RACINE" H.S. Tungsten-Power Blades.

MALLEABLE AND CAST IRON PIPE FITTINGS

The Brand That Has The Quality

"Quality" and "Reliability" are two essentials demanded of *Cast Iron* and *Malleable Fittings*, by all sanitary and heating engineers.

Time and money are lost by improperly made fittings. All our cast iron and malleable fittings are properly recessed and every fitting bears the above trade-mark of quality.

We make a complete and full line of both flanged and threaded fittings from ⅛-inch up, and can make deliveries from stock, both standard and extra heavy.

When ordering from your jobber be sure you buy---"the brand that has the quality." They are different. A trial order will convince.

Malleable Iron Company, Limited
Guelph, Ontario, Canada

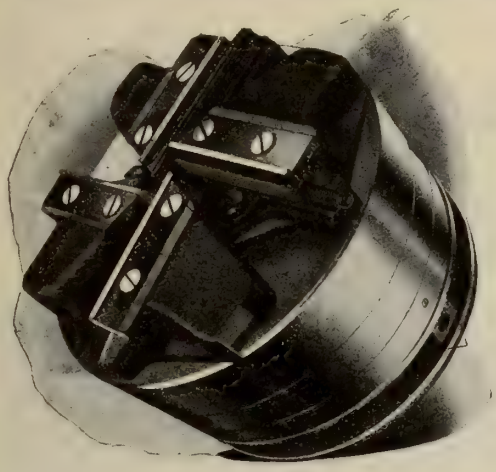
How Many Threads in a Dollar?

That is the all-engrossing question of the manufacturer to-day, whether cutting threads on a production basis or as a maintenance proposition.

Landis Threading Die Heads and Machines insure profitable threading because:—

The chaser like a lathe tool is tangentially disposed to the work, eliminating all unnecessary friction.

The chasers are interchangeable in that any one or more may be replaced without renewing the entire die.



The chaser has a variable cutting angle which may be ground to suit the material being threaded.

The chasers never require recutting but when dull are given a slight grinding.

The chaser is 4 inches long, giving a life twenty times that of other dies.

Your money invested in the Landis Die will yield big returns in best quality threads.

Catalogue 24 tells the whole story.

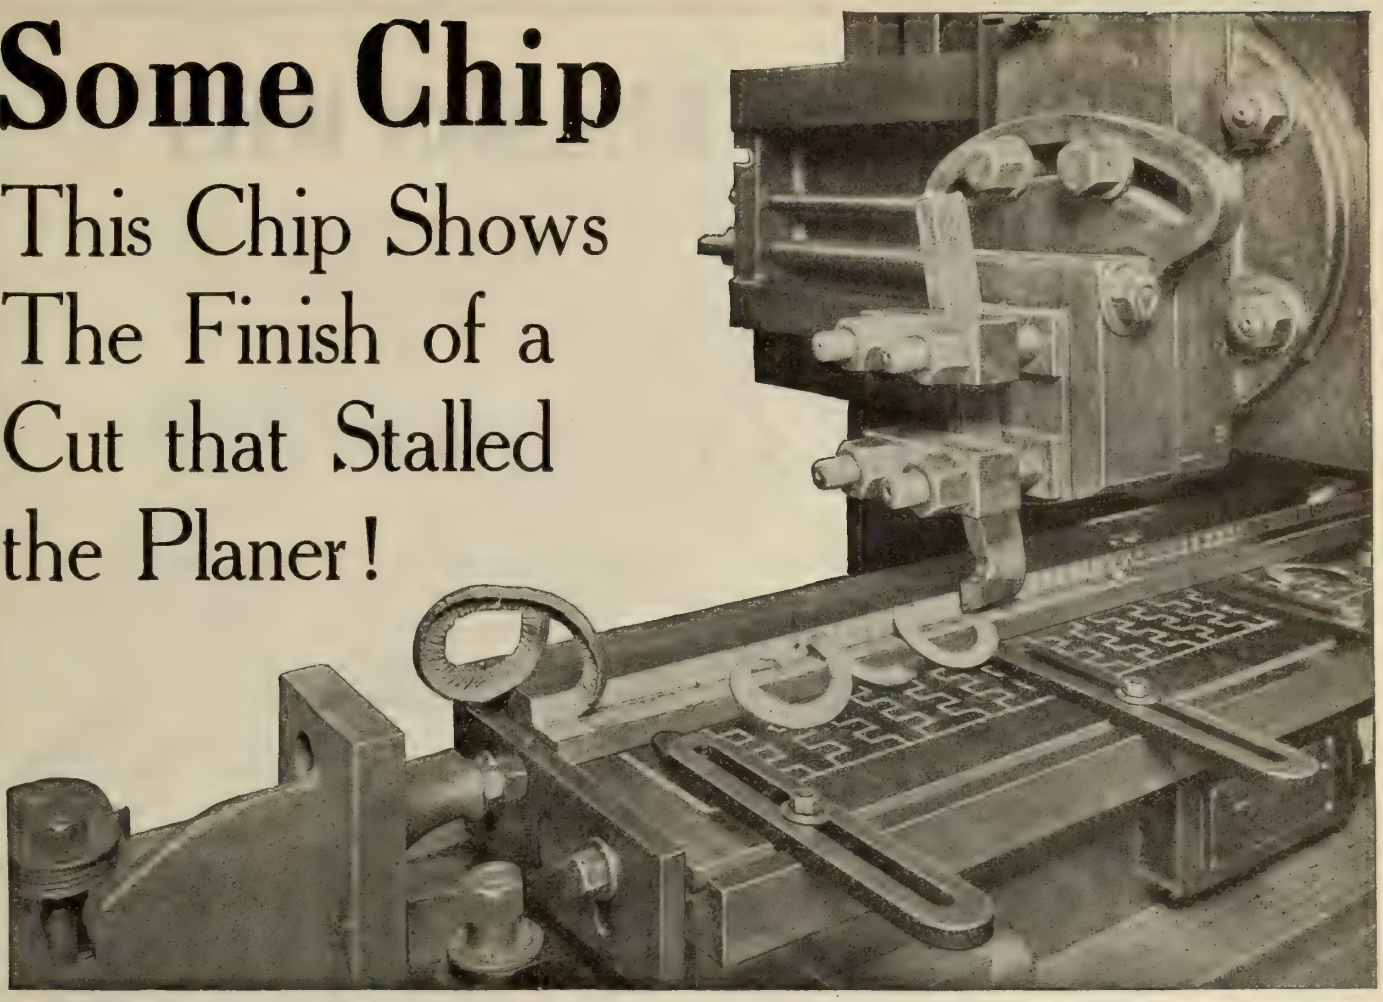
Some Chip

This Chip Shows The Finish of a Cut that Stalled the Planer!



The cut was started at the far end of the piece and the work never budged.

Some of the factors that contribute to the holding power and reliability of the SIMMONS UNIT-POLE MAGNETIC CHUCK are

1—Effective utilization of the space on the face of the chuck;
2—Use of unit magnetic pole pieces of forged iron placed adjacent to each other with no neutral poles or neutral spaces between them;
3—Gaps between poles uniform throughout because adjacent edges are machined to definite dimensions;
4—Complete magnetic circuit insulated from the body of the chuck —a patented construction.
5—Machine wound coils assure uniform quality and equal ampere turns in all;
6—Interlocking pole pieces offer transverse as well as longitudinal resistance to the work;
7—Watertight construction.

DETAILS OF TEST

The test here shown was made on a 30-inch Gray planer equipped with a 31 x 10¼ inch T-slot Simmons Unit-Pole Magnetic Chuck. The cut was taken on a cold rolled steel bar 31 inches long, 4 inches wide and ¾ inch thick. The chip was ⅝ inch deep and 3-16 inch thick. It stalled the machine.

The Simmons unit-pole magnetic chuck works where others fail, because it is designed in accordance with the principles of correct magnetic practice and gets the maximum pulling power that can be obtained in a given space. Catalog 105E will be mailed on request.

THERE IS "A REASON WHY"

When Germany signed the Armistice, Walcott Lathe Company accepted cancellations of orders for Lathes amounting to hundreds of thousands of dollars. Not one cent of damage from the United States Government or anyone else was claimed on account of the cancellation.

YOU SAY, WHY

Because Walcott Lathes are standard equipment throughout. They are built and designed for manufacturing purposes in sizes to meet every requirement of your shop. Thus, we have had a constant increasing demand for Walcott Lathes for the past thirty-eight years, not from one section of the country, but from all over the world. Our business is good, and our plant is running full time, not a man idle.

If you are interested in new Lathes, specify the WALCOTT, and you will find by their many advantages "The Reason Why."

Making Production Men Sit Up and Take Notice

You can't judge a tool by an occasional fine performance. But no production man can ignore the long series of extraordinary service records made by

DAVIDSONIZED High Speed Steel Tools

Here's another recent performance, stripped to the naked facts (name of plant on request):

Clevis Milling Job. Four side-milling cutters on arbor, each 6 in. x ½ in. x 1 in. Material: High Manganese Carbon Steel, forged stock. Standard production speed, 150 pieces per 8 hour day. Best previous tool performance: 800 to a grinding.

In the competitive tests, the two outer cutters on the arbor were Davidsonized Tools, and the two inner ones of a well known standard make.

One of the inner cutters had to be taken off after 726 pieces; the second set did 750. *After these 1476 pieces,* at which point the test was discontinued, *both Davidsonized Cutters were still in practically as good condition as at the start.*

Apply this comparison to some job of your own and see what it would mean to you in terms of your own costs. Figure not only getting out the same work with one-half the number of grinders, but the saving in the overhead and labor items through reduction of take-down and setting-up time. Then write us for further particulars, or say when our representative may call.

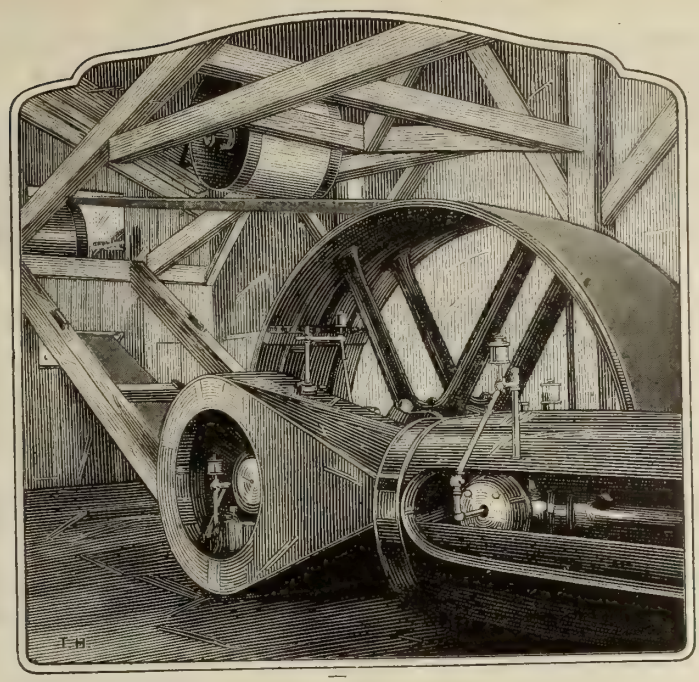
Through the scientific investigation of our Engineering Department, all the factors which enter into the design of a belt have been standardized. According to best modern practice, belts are designed with an overload capacity of about 60%. Such ratings are found to give the lowest cost per horse-power transmitted per year.



48" Heart 3-ply Belt, 86 feet long, installed in 1911 in the mill of the C. A. Smith Lumber Company, Baypoint, Cal. Driving Pulley, 14 feet, 101 R.P.M. Driven Pulley, 4 feet. Belt Speed, 4400 F. P. M. Theoretical horse-power, 600. Actual horse-power transmitted, 850 to 900. Cost of Belt, 1-5 of 1c per horse-power per week.

"Where Little Things Are Big"

Think what this belt must do. Travelling at 4,400 feet per minute, it makes its circuit fifty times every sixty seconds. For every one of these revolutions, each part of the belt must slacken and tighten itself, practically once a second.

To be efficient, it must do this without loosening its grip on the pulleys, without jumping or slipping. That this 48" Heart Belt does transmit power efficiently is evidenced by the fact that it is delivering 250 more horse-power, or over 40% in excess of that for which it had been designed. It has been doing this for over 8 years.

The test of such conditions seems impossibly severe, and yet this belt succeeds because it is made from the right material—leather—which has retained so many of the wonderful properties that fit it to be the skin of a powerful, active, living animal.

In order that our leathers may meet these almost impossibly severe requirements of elasticity and pulley grip, we tan them ourselves specifically for belting use, handling 1,000 hides a day.

That we may offer always the right belt for the required work, we make our Standardized Series of Leather Belting—a Belt for each class of power transmission. Standardized in manufacture, and standardized in application to the work to be done.

Many of the best belted plants ask us to specify the belting for every *pulley* drive. Try the plan yourself. Then, when buying, call for "Graton & Knight—Brand or equal." This won't commit you to buying our belts. It will put your buying on the one basic consideration—the work to be done.

Notes On Grinding
NORTON COMPANY WORCESTER, MASS.

No. 59A

Judging the Grinding Action

Because of so many unavoidable variations in the size and structure of the casting or billet it is a difficult task to determine the relative merits of snagging wheels. But the only reliable factors for judging of the suitability of an abrasive structure are the rate of cutting and the amount of abrasive material worn away per unit of volume of metal ground. Any other basis of selection is an approximation for these two quantities, and experience has shown that even the opinion of expert grinding operators is subject to many uncertainties unless supported by actual data on the rate of cutting and grinding capacity.

IMPORTANCE OF OPERATING CONDITIONS

In fact if these data were daily collected for a long period of time, it would be seen that the action of a snagging wheel is very sensitive to any variation of the following conditions:

1. The manner in which the grinding wheel is applied.
2. The speed of rotation.
3. The daily changes in structure of the metal, "chill" and amount of metal to be removed.
4. The method of grinding employed by the operator, whether the work is done with the edge of the wheel or the face, and the amount of traverse of the work with respect to the wheel.
5. The rigidity with which the work is held while being ground.
6. The condition of the grinding machine with especial reference to the bearings, tension, and width of belts, and amount of power available.

Each of these factors may have more effect upon the grinding action than a change of grit or grade of the abrasive structure. That is why no one can reliably foretell the grit and grade of snagging wheel best suited for a particular set of operating conditions. Foundries of the same concern and making the same product will select grinding wheels of different structure.

Agricultural Machinery Manufacturers! Here's Something for You

The Norton Grinding Company can help you keep down your manufacturing costs, improve the quality and finish of many of your products, and increase the output.

One of the best known agricultural machinery manufacturers uses large numbers of bronze bushings for connecting rods in a large 75-h.p. motor built by them. This concern finishes them on a 6 x 32-in. Norton Grinding Machine. The operator removes 1-32 inch stock and is allowed a tolerance of 0.001 inch. His average output is one every minute. Our Service Department will gladly furnish you with information on plain grinding. Perhaps you have work that could be done more profitably that way. Send us your blue prints.

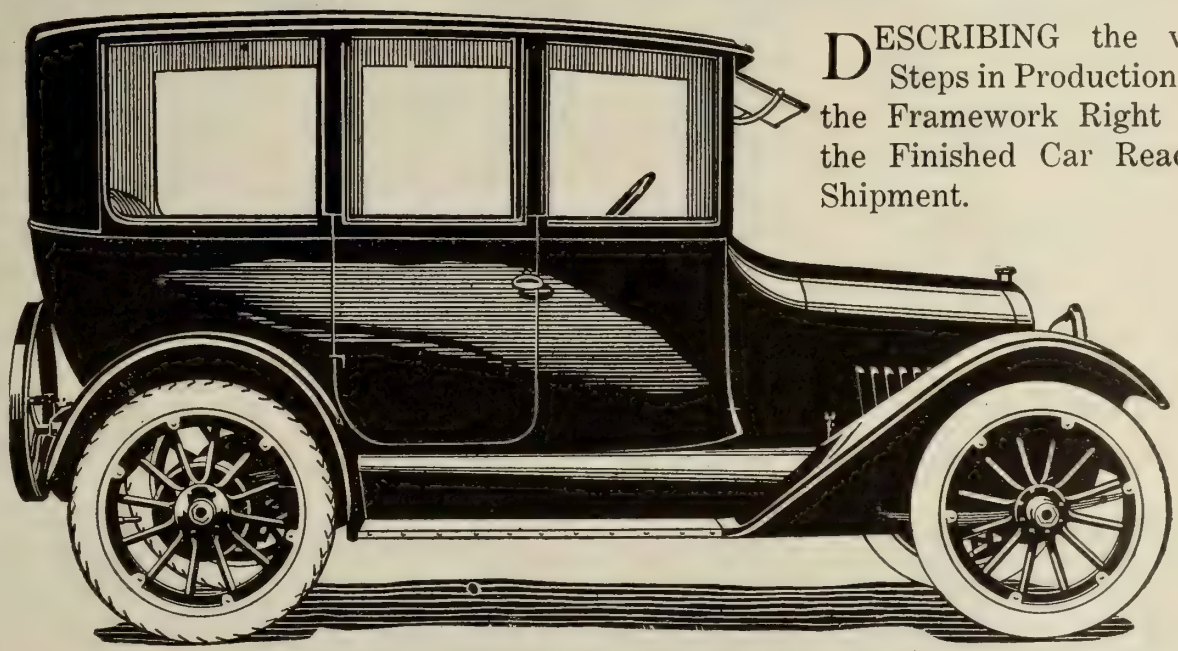
MANUFACTURING NEWS

Volume XXII. No. 1. Toronto, July 3, 1919

Manufacturing the Chevrolet Motor Car



DESCRIBING the various Steps in Production, From the Framework Right Up to the Finished Car Ready for Shipment.

By J. H. MOORE, Associate Editor Canadian Machinery

IT is a well-known fact that in some cases where an article on some particular machine or subject is to be prepared, the first customary step is to describe the product itself before going on to its manufacture. In this case in point, however, such a description would be superfluous, for where is the man or woman, yes, even the kid (as we generally term them), who cannot tell you what an automobile is. What's more, even the children can proudly say as a car whizzes past, "That's a ——," as the case may be.

But how does it come that even the kiddies can pick out a certain type of car from amongst so many different types? If the writer is allowed to answer his own question, here is at least his humble opinion. The child overhears its parents or some other party of older years discussing the various cars on the market, together with their records, price, etc., etc. A child's mind is very fertile, and, naturally, the information falls in good soil, so we later hear them exclaim as the car goes past, "There goes a ——."

Now, since we've reached this point, let us ask readers another question. How often have we heard a kid saying, "There goes a Chev." (which is their favorite pet name for the Chevrolet car).

Quite often, no doubt, which proves the writer's previous theory, that the kids soon learn to know of the car whose price, performance, and record, are well known. In other words, they soon get to know the name of the popular car, which in common parlance, means the Chevrolet, for this car has been discussed by no doubt half the population of Canada.

CANADIAN MACHINERY figured it out this way: People in general are interested in this automobile, so why not the mechanic? No doubt he will be even more interested. Arrangements were made to secure such an article with the result to follow. In as far as possible we will describe the various processes throughout, but naturally readers can understand that there must be certain operations which cannot be gone into in detail for obvious reasons.

As readers no doubt already know, the Chevrolet Motor Car Company of Canada, Ltd., have their plant located at Oshawa, Ont. These quarters are spacious, to say the least, and some idea of their exterior appearance can be gleaned from the photograph at Fig. 1, showing a general view as we approach the plant.

To the extreme right of this picture will be noticed a portion of the main office, while on the extreme left is shown the production and cost department office building. Further in the rear readers will notice a portion of the plant building, with the covered bridge going from one building to another.

Referring for a moment to the office staff. Here we find some 100 workers, busily engaged in carrying on the different departments of office routine, which gives readers a slight conception of the vast volume of business which passes

FIG. 1—GENERAL VIEW OF A PORTION OF THE PLANT AS IT APPEARS FROM THE STREET.

through their hands. But we will not dwell on the office problems, for this article is chiefly intended as a manufacturing study.

It will not be amiss at this point to first of all describe the various models of cars which this firm turns out. They have what is known as their Model 490, a serviceable car of lighter weight than their next, Model F.B., or, as it is better known, their Baby Grand Model. This latter car is a larger and heavier model than the former one spoken of.

To allow readers to compare these cars from a photographic standpoint, the writer has illustrated this article with photographs of both models spoken of. A study of the specifications, which follow later in this article, will further allow comparison between these two cars.

In addition to these models, they also manufacture a light delivery waggon, also a one-ton truck.

So now that we have mentioned these different types, let us go into the actual manufacture of the Model 490 and F. B. cars.

The various operations on these models are similar, so that for the purpose of this article one description will suffice for both cases, but underneath each photograph readers will find a description of the type portrayed.

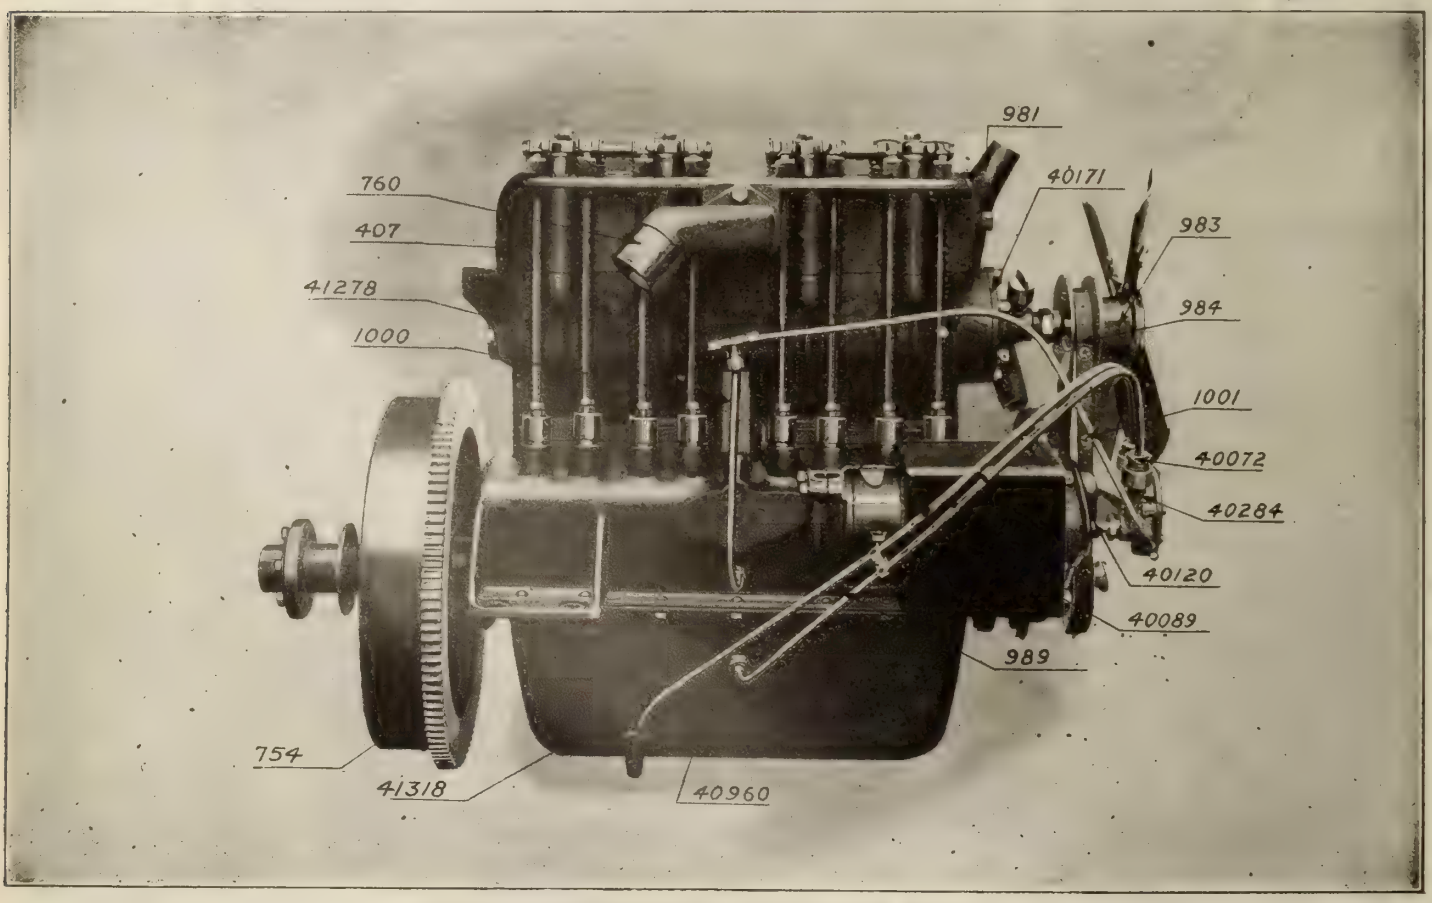
The Frame

To commence with, let us consider the frame. This portion consists of some twenty parts, not to speak of the rivets used on the same. This frame is first of all drilled, and later assembled, the various pieces being riveted together. This latter operation is a very interesting one to watch. Air hammers are used for this purpose throughout, speed being the big factor. Air hoists are also employed to lower these frames to the trucks on which they from now on rest, until their completion. These trucks are of course specially constructed to accommodate the frame, being of correct length, shape, etc., so that it is but the matter of a moment to place the frames firmly on same.

GENERAL APPEARANCE OF CAR MODEL 490.

The springs and axles are now assembled to the frame, after which they are transferred to the department where the motor is assembled to the frame.

Before going on to this operation, however, let us see what has been happening while the frame has been passing



1918-1919 MOTOR WATER PUMP COOLING SYSTEM, MODEL 490 CAR.

FIG. 2—ASSEMBLING THE MODEL 490 ENGINE.

through its various stages of manufacture.

Directly across the floor from the frame riveting department, the "490" model motor is assembled. Fig. 2 illustrates clearly an assembler at work on one of these engines. The motor is assembled with great care, and is carefully inspected at a later stage of manufacture.

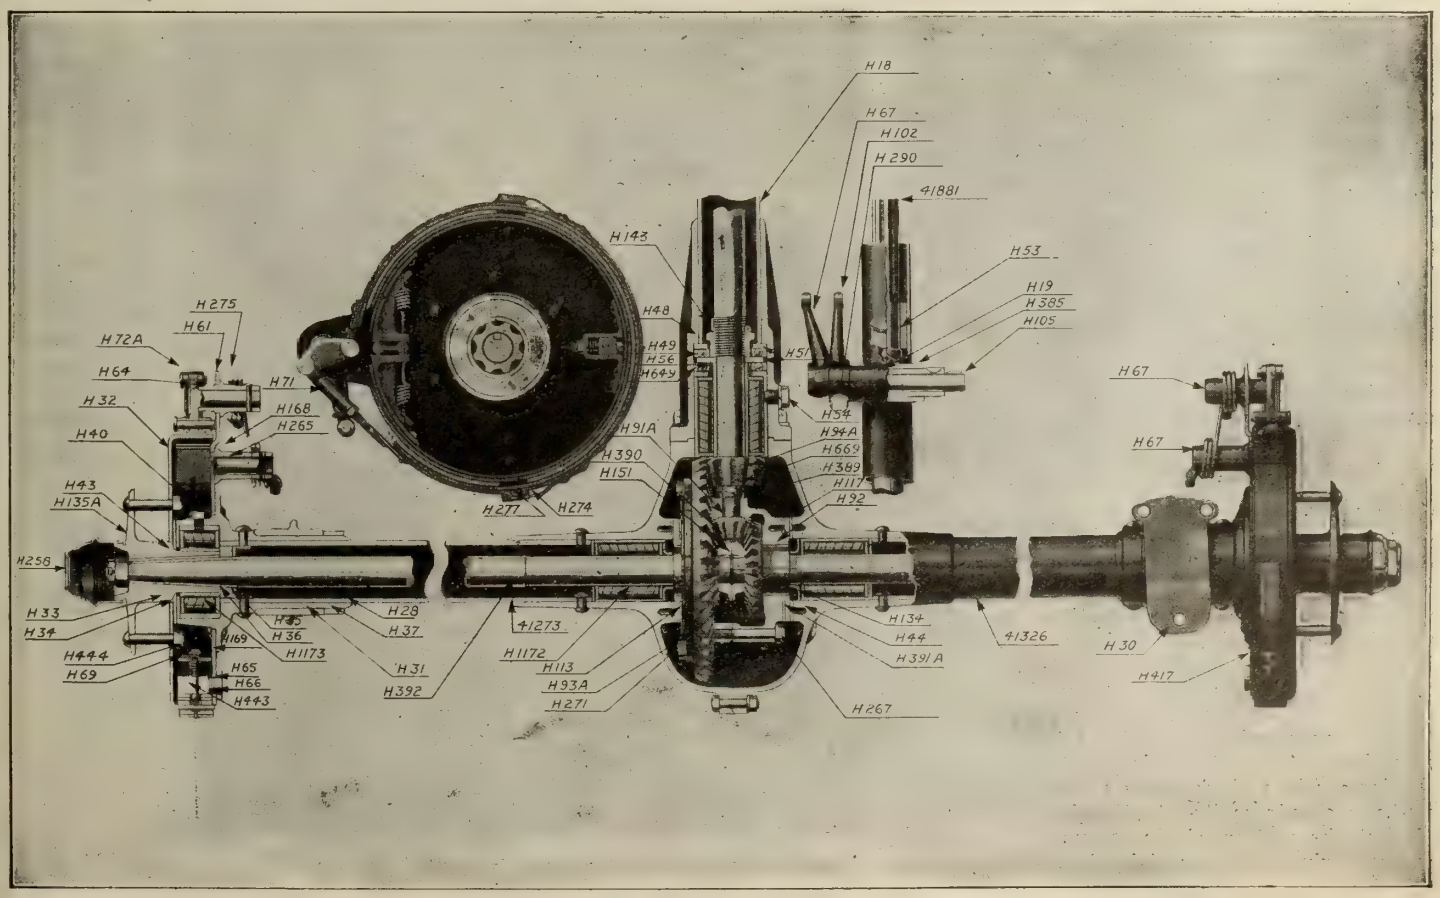
These motors now go to the same department as the frames, where the motor is assembled to the frame. They now pass on a little further (in fact merely a distance of the length of the truck).

Motion Study

It will be noticed that while speaking of these various steps, the words "pass on" are used quite a bit. In reality this is what actually happens, for each assembler right down the line has his particular portion to assemble, after which he gives the truck a push one length ahead to the next assembler, and so on. Each movement is carefully thought out in order to reduce lost motion to the minimum. In this way better work is accomplished, for each man becomes a specialist in his own particular operation, and his work is likewise more speedy the longer he stays at it.

Production soars by the adoption of this modern method of manufacture, in fact a car of such a standard as the one described could never be turned out for the money they now sell at were it not for this study of motion and operations.

The muffler, starting gear, underpan, drip pan, radiator, coil distribution tank, tire carrier, etc., are now assembled, after which the frame is inspected, and all necessary parts filled with oils and grease. The framework, or chassis, as it is often called, now looks like the view shown at Fig. 3.



DETAILED VIEW OF REAR AXLE ON THE MODEL 490 CAR.

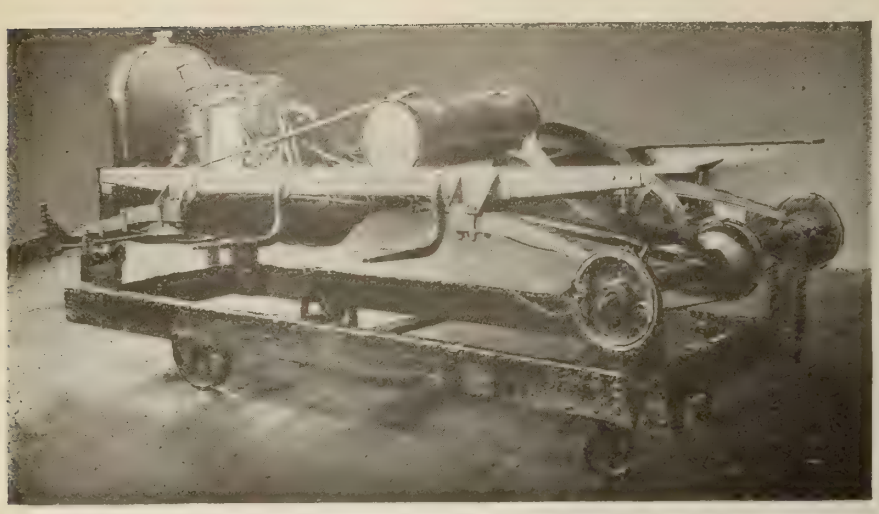


FIG. 3—MODEL 490 CHASSIS JUST BEFORE IT ENTERS THE AIR GUN PAINTING CHAMBER

Air Gun Painting

The chassis now goes into a special painting chamber, where it is painted by means of an Aeron air gun. This method produces a good, even, penetrating coat of paint, at the same time speeds up the work. When we mention that the operator takes only 10 minutes to paint one of these chassis, readers can get some idea of the speedy work. The photograph at Fig. 4 gives one a good conception of this operation. The doors marked A and B in this photograph swing open after the chassis is painted, when the operator pushes the truck through these doors into the drying oven. Here they go through a drying process, which takes approximately 45 minutes for the frame to pass from one end of the oven to the other.

The Mounting Department

As they come from the other end of this oven the frames enter into what is termed the mounting department. Here they go through various steps of assembly as follows: the bodies are lowered through an aperture in the floor above on to the chassis, when both body and frame are carefully assembled. These bodies are lowered through the floor in a finished condition, having been previously assembled in another department.

Later in this article we shall describe how these bodies are assembled, but for the present we will stick to the routine of operations of the car on its way to completion.

Let us, however, just for a moment, describe the novel way these bodies are lowered.

At certain distances along the second floor there is built areaways or openings through the floor. Of course they are protected from the danger of falling through by means of a built-up partition all around the openings. At each opening is placed two one-quarter ton Morris air hoists, which are so arranged that they will swing even more than the limits of these openings, a hoist being placed at both sides of the hole. In this way bodies can be picked up from either sides of the opening without difficulty.

It is but the matter of a moment to pick up a body, for a special sling is constructed from ordinary pipe, and arranged with quick action catches, so that the description really takes longer than the actual operation of picking up a body, swinging it over the opening, and lowering on to the frame. Next the fenders, running boards, aprons, or skirts as they are sometimes called, are assembled. After this has been completed the car appears as shown at Fig. 5. (Note: This photograph illustrates the F. B. model.)

Final Assembly

The final assemblers now get to work, and go all through and around the car, putting everything in proper shape. The wheels, with tires in place, are now assembled, after which the car is run up on a raised runway as shown at Fig. 6 (also the F. B. model).

Here various other adjustments are made, when the now nearly completed car passes on to still another step. The cover is next placed on the body, after which a final assembly inspection of the now completed car is gone through.

From this point the cars are taken to the test department, where every car undergoes an actual road test before being passed as O. K. Should a defect of any nature show up, the same is remedied at once, and another road test is gone through. In other words, the car must prove on its road test that it is in first-class condition, otherwise the inspector will not pass it for shipment.

It is now forwarded to the shipping department, where it is later placed in the box cars (if the distance warrants such a procedure) and carefully packed and fastened in place. Should the destination of the cars be within a radius of say 100 miles, the cars are usually driven over the road, in place of sending by train. Of course readers can understand that this is a matter which varies, depending on conditions.

As we have now, so to speak, completed the process of assembly, let us consider various other points of interest in the manufacture of different portions of this car.

The Bodies

It is an extremely interesting trip for one to pass through the body assembling building, for here we see various shaped pieces of wood, which, in their raw state, look very unlike automobile bodies indeed. But in a re-

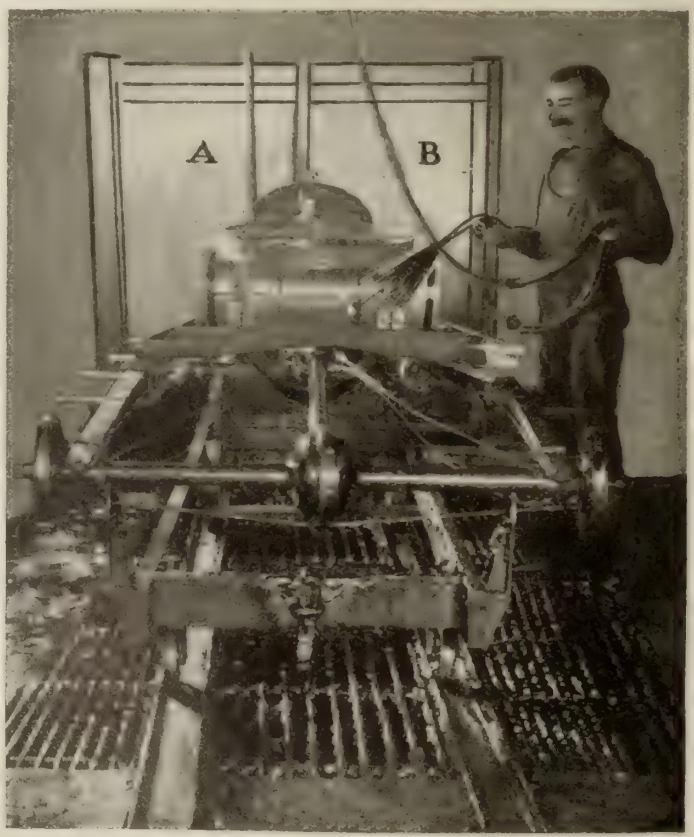

FIG. 4—THE MODEL 490 CHASSIS BEING PAINTED BY THE AIR GUN PROCESS.

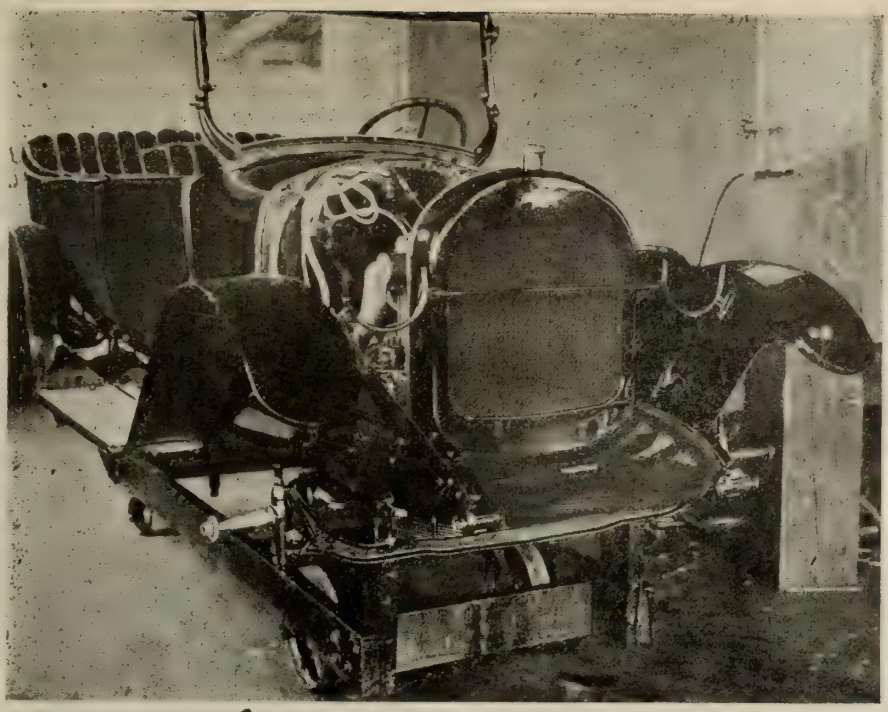

FIG. 5—THE MODEL F.B. CAR IN FURTHER PROCESS OF ASSEMBLY.

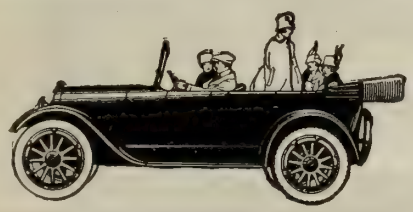
markably short time, what a change is seen! Pieces match together almost like magic, and before very long we have a



GENERAL APPEARANCE OF CAR MODEL F.B.

complete wooden framework, of which even the novice could safely venture to say, "That's going to be a body for an automobile."

The next stage is the metaling of the framework, that is the sheet steel coating or covering is carefully nailed on in place. Every stage now improves the body's appearance. The latches, and all other little attachments, doors, etc., are next added.

The upholstery is later installed, and Fig. 7 will give readers a sort of general idea of a small portion of this department.

Welding the Body

Before passing on to any further operations on the body, the writer feels that special mention should be made of the photograph shown at Fig. 8 which illustrates the worker busy welding together the back portion of the body to the side wings, that is the side portions covering the rear seat portion of the car. A special holding jig, as shown, has been made for this purpose, and this scheme has increased production of this work to a wonderful extent. Readers will notice that the photo shows the torch in actual operation.

Painting the Bodies

While it will be impossible to go into the painting in detail, we can at least touch on the various steps of operation, which will illustrate the care that is put on these bodies in order to produce a finish that will stand up under the various weather conditions and rough usage, such as practically all automobile bodies must go through.

First the body is washed with benzine and rubbed down with emery paper, after which a coat of oxide primer is applied. They are now sanded, next colored, then once more re-sanded.

A coat of outside body color varnish is now applied, after which they go through what is termed the Floco process. This Floco, as it is called, is a sort of hollow brush (if one can use such a term) which, on being operated, produces a steady flow of whatever material is being used. On the operation spoken of, the body is Flocoed with green varnish.

They now go to the drying ovens, after which they go to the trimming shop where the black line is painted on at the top of the body, which, to use the shop term, is called "cut-off." They are also striped at this department. To those familiar with the painted appearance of this car, the above remark is self-explanatory, but for the benefit of others it might be best to explain that there is a thin white line carried all around the body portion of the car. This is what is termed striping.

They now go to the finishing room, where they are washed with a mixture of gasoline and water, and lastly, Flocoed once more with a finish coat of varnish.

The advantage of this method is self-apparent, for no brush marks can result from such a finish coating. The bodies for this operation are placed over a huge tray, which catches the overflow material, for to watch the steady flow of varnish which is run carefully all over the body, readers can readily understand the excess material is bound to drip off. For this reason the tray spoken of is absolutely essential.

After being allowed ample time for dripping they are placed in the drying ovens, after which they are complete for the final assembling of the body.

Building the Top

Referring to Fig. 9, which illustrates

FIG. 6—THE MODEL F.B. CAR NEARING COMPLETION.

FIG. 7—A VIEW OF A SMALL PORTION OF THE ULPHOLSTERY DEPARTMENT.

one of the Baby Grand covers in process of assembly, it will be noticed that these tops are built on a specially constructed framework. The design, as shown, is exceedingly simple, yet such a stand speeds up production to a wonderful extent.

First the bows, as they are called, are assembled, then the Vizor pads, both right and left. Next come the stringers, back curtains, deck, front and back, then the finishing of the raw edge, that is, the complete appearance of the top when finished is in keeping with the rest of the car.

Assembling the F. B. Model

In order to give readers an idea of the motor and transmission assembling for the F. B. car, we illustrate at Fig. 10 two assemblers at work putting this engine together. This photo is practically self-explanatory.

Before closing this description of the Chevrolet plant, perhaps readers would be interested in reviewing the specifications on both the 490 and F. B. models in order to draw a comparison between their sizes, etc., so the following are their chief specifications, which will at least point out the other details of construction which were hardly practical for the writer to touch upon.

Specifications for Model 490 Touring

Motor: Four-cylinder, valve-in-head type, 3 11/16″ bore, 4″ stroke.
Cylinders: Cast en-bloc (including upper half of crank case). Head detachable.
Valves: 1½″ diameter.
Connecting Rod Bearings: 1⅜″ diameter. 1⅞″ long.
Crankshaft Bearings: Front, 1⅜″ diameter, 2 5/16″ long; Center, 1 21/32″ diameter, 1½″ long; Rear, 1¾″ diameter, 2 11/16″ long.
Camshaft Bearings: Front, 1 5/16″ diameter, 2⅜″ long; Center, 1 9/32″ diameter, 2″ long; Rear, 1¼″ diameter, 1 7/16″ long.
Oiling System: Splash, gear pump and individual oil pockets. Oil pressure gauge.
Carburetor: Zenith improved double jet.

FIG. 8—A CLOSE-UP VIEW OF THE WELDING FIXTURE FOR BODIES.

Ignition: New improved Remy.
Clutch: Cone type with adjustable compensating springs.
Transmission: Selective type, sliding gear; three speeds forward and reverse.
Cooling: Water pump; radiator extra size.
Front Axle: Drop-forged I-beam.
Rear Axle: Three-quarter floating, wheel bearing carried on the wheel-hub and in axle housing, not on axle shaft. Hyatt roller bearings.
Brakes: Emergency, internal expanding type; service, external contracting type 10″ brake drums. Foot control.
Wheels: Wood, artillery type, demountable rims, large hub flanges.
Tires: 30″ x 3½″, non-skid on rear.
Drive: Left side; center control; spark and throttle under steering wheel. Foot accelerator.
Steering Gear: Spur and gear, adjustable for wear. 15″ steering wheel.
Springs: Semi-cantilever, front and rear.
Body: Five-passenger Touring Car.
Wheelbase: 102″.
Equipment: Electric lights and starter, highest type two-unit system, single wiring used. Complete lamp equipment, mohair tailored one-man top, top cover and side curtains; tilted windshield; speedometer; electric horn; extra rim and carrier on rear; complete tool equipment, including pump and jack. Foot rest, robe rail, pockets in each door.

Specifications of Model F. B.

Motor: Four-cylinder, valve-in-head type, 3 11/16″ bore, 5¼″ stroke.
Cylinders: Cast en-bloc with upper half of crank case. Head detachable.

FIG. 9—ASSEMBLING THE MODEL F.B. TOP.

Valves: 1½", enclosed.
Connecting Rod Bearings: 2⅛" x 1½".
Crankshaft Bearings: Front, 2 11/16 x 1½"; Center, 2" x 1 31/32"; Rear, 3½" x 2".
Center Main Bearings: Doehler bronze black.
Crankshaft Bearings: Front, 2¼" x 1 9/16"; Center, 2" x 1½"; Rear, 2" x 1 15/32".
Oiling System: Gear pump. Oil pressure gauge on dash.
Carburetor: Zenith improved double jet.
Electric System: Auto-Lite generator, starting motor, and lighting system. Two-unit type.
Ignition: New improved Remy system.
Clutch: Cone, leather faced, with adjustable compensating springs.
Transmission: Selective type, three speeds forward and reverse.
Front Axle: Drop-forged I-beam with integral yokes. Wheels fitted with New Departure ball bearings.
Rear Axle: Three-quarter floating type. Shafts run on Hyatt roller bearings.
Cooling: Water pump; radiator extra size.
Brakes: Service, external contracting; emergency, internal expanding (hand-controlled); 12" brake drums.
Springs: Front, semi-elliptic; rear, semi-cantilever.
Tires: 33" x 4", non-skid on rear. Plain tread on front.
Drive: Left side, center control.
Steering Gear: Worm and gear wheel, 17" steering wheel with inserted spider.
Gasoline Supply: Seventeen-gallon tank hung on rear, with gauge. Stewart vacuum system.
Wheelbase: 110".
Equipment: Electric lights and starter; highest type two-unit system, single wiring used. Complete lamp equipment, including headlight dimmers; electric horn; speedometer; demountable rims, with extra rim; tire carrier; license holder.

In conclusion, let us for a moment consider production figures. A year's production at this plant means twenty thousand completed automobiles, which give one a real idea of the splendid system and routine which has been installed. The gentleman who accompanied the writer on his trip through this plant remarked: "Yes—and we will no doubt do still better as time goes on," which shows clearly, that although this plant is run on a good systematic basis, still the watchword is "Increased production" all the time.

Perhaps at a later date CANADIAN MACHINERY may be able to secure valuable material for their readers in regards to the cost and production system as employed by this up-to-the-minute concern.

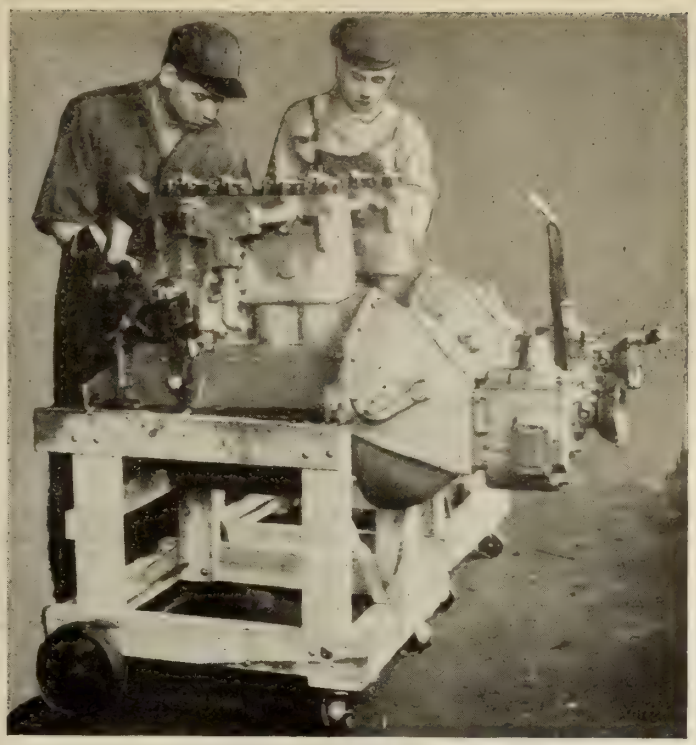


FIG. 10—ASSEMBLING THE MODEL F.B. ENGINE.

The Electric Furnace and the Non-Ferrous Metals

The Following Paper Was Read by the Author Before the Cleveland Engineering Society on March 11. The Utility of the Electric Furnace for the Melting of Non-Ferrous Metals and Their Alloys is Clearly Developed

By E. F. COLLINS, General Electric Co.

Continued from June 19th issue

IN fact even though melted under a charcoal cover and CO blanket, copper needs a deoxidizer to free it completely from oxygen. The above troubles should not appear in connection with electric melting, since the furnace chamber may be kept uncontaminated and free from oxygen and injurious gases.

Fifth Source of Melting Loss

Loss of zinc is proportional to the temperature and length of time a metal is held at the high temperature. This statement means that if you melt one charge at the rate of 100 lbs. per hr., and the second charge at the rate of 200 lbs. per hr., then, all else being the same, the melting loss of second charge will be less than the first charge. Electric methods of melting lend themselves to much quicker melting or higher melting rates than with fuel fired furnaces, viz., melting rate electric, 1,500 lbs. per hr.; fuel fired, 1,500 in 2¼ hrs.; 600 lbs. electric in ½ hr.; fuel fired, 600 lbs. in 3 hrs.

Determination and Measurement of Metal Loss

Metal loss in melting is ordinarily best judged from chemical analysis of metal charged. This test eliminates errors arising from furnace wall absorption or the reverse, also losses in pouring.

To show the inconsistency of actual recovery methods of loss test, the following results of comparative tests on coal fired crucible furnace and electric furnace (crucible capacity 250 lbs., electric furnace capacity 1,500 lbs.) are presented. Metal was poured from crucible direct, whereas auxiliary ladle was used to pour 1,500 lbs. electric furnace, giving chance for more loss in pouring.

METAL RECOVERY TEST
(Actual test on Red Brass.)

Metal Charged	Metal recovered	% Loss	Type Furnace
1 heat 1500 lbs.	1465 lbs.	2.33	Electric Tilting
1 heat 1500 lbs.	1484 lbs.	1.07	Electric Tilting
4 heats 250 lbs.	980 lbs.	2.00	Coal fired crble.
4 heats 250 lbs.	990 lbs.	.85	Coal fired crble.

Chemical analysis for melting loss on the same electric furnace, and same metal showed approximately .4% Zn. loss.

Analysis of metal charged:—

S.N.	Pb.	Cu.	Zn.	Fe.
4.30	6.55	80.80	8.02	.25
4.29	6.60	81.46	7.61	.25
(Poured ele.)		(No charcoal.)		

ACTUAL TEST (YELLOW BRASS) ELECTRIC FURNACE.

Metal Recovery Test.

Metal Charged	Metal poured	Loss
600 lbs.	590 lbs.	1.6 %

Analysis Metal Loss.

TABLE NO. 3.
Nonferrous Metals Melted in Electric Furnace.

Metal	Condition of Metal Charged.	State of Metal After Melting.	KW. hrs per Ton to melt.	Metal loss in melting.
Copper	Electrolytic Cathode Pig Scrap—Heavy. Scrap—Light. Scrap—Dirty. Chips—Oily. Chips—Clean.	Pig at pitch without rabbling or poling Wire bar. Foundry Castings.	300 to 500	No oxidation; a certain amount of copper oxide is reduced.
Zinc	Electrolytic Cathode Pig. Punchings. Chips. Heavy scrap	Pig. Foundry castings. Billets for rolling. Battery electrodes.	90 to 120	Dross and Oxidation under 2%.
Nickel	Shot. Bar. Scrap.	Pig. Foundry castings. Billets for rolling.	500 to 750	No oxidation loss.
Alum.	Pig. Scrap. Punchings. Turnings.	Pig. Foundry castings. Billets for rolling.	400 to 750	Less than 1% oxidation.
Tin	Bar. Pig. Scrap.	Bar. Pig. Wire.	40 to 60	No oxidation.
Lead	Pig. Scrap. Sheet.	Billets for rolling. Casting. Pig.	20 to 40	No oxidation.

TABLE NO. 4.
Nonferrous Alloys Made in Electric Furnace.

Metals	Condition of metal charge.	State of Alloy after melting.	KW. hrs. per Ton.	Metal Loss.
Red Brass— Cu. 80 Zn. 10 Sn. 6 Pb. 4	Scrap pig, electro. cathodes. Scrap—bar. Scrap—pig.	Foundry castings. Wire bar. Billets.	250 to 400	.25 to .7, depending upon manipulation of furnace.
Yellow Brass— Cu. 60 Zn. 39.5 Pb. 00.5	Scrap, Pig, Electro. cathodes. Scrap, Pig.	Foundry castings. Wire bar. Billets for rolling.	220 to 350	.50 to 1.5.

TABLE NO. 5.

Alloy.	Condition of alloy charged.	State of alloy after melting.	KW. hrs. per Ton.	Alloy Loss	Temp.
Red Brass	Yellow brass and copper or Red Brass and Zinc Pig Scrap and sprues, turnings and chips.	Foundry castings. Wire bar. Billets.	225 to 300	.15 to .50	1300°
Yellow Brass	Red Brass and Zinc or Yellow Brass and Zinc Pig Scrap and sprues, turnings and chips.	Foundry casting. Wire bar. Billets.	200 to 275	.40 to 1.00	1100° C.
Monel					
Copper Nickel	Scrap and billets.	Foundry casting. Billets.	500 to 750	No oxidation.	1600° C.
Aterite Cu.	Sprues, Scrap. Ni. Virgin metal. Zn.	Foundry casting. Billets for Drawing Rolling.	500 to 750	2% zn. loss	1650° C. Out of 32%.

The results given in tables 1 to 4 are average figures and will be influenced to meet any particular foundry by (a) promptness of pouring, (b) temperature (since pyrometers are seldom used), (c) local conditions such as physical condition of metal charged, its cleanliness, volume of air and products of combustion which pass through the furnace in natural draught furnaces. This varies from day to day, depending on the weather, (d) design of furnace, (e) manipulation of furnace, (f) size of crucible, (g) percentage of composition, (h) length of working day, (i) whether observations are based on hot furnace and hot crucibles or whether first heat of the day is excluded, (j) pouring light castings require hot metal, and heavy ones metal at lower temperature, (k) whether results are from careful tests or whether they represent actual foundry or rolling mill practice and extend over a considerable period.

Chart 4 illustrates how a furnace able to turn out metals for 300 kw. hr. per ton, due to foundry handicap, averages only 350.

Cost of Melting Brass in Fuel Fired and Electric Furnaces

The speaker presents table as a resume of that which precedes it in the paper, relating to cost of melting brass per ton with the various typical fuel fired furnaces, and also with the electric brass melting furnace. This table is an average table and results for individual foundries may be readily found by substituting in the itemized costs those which obtain there, i.e., .5 cents per kw. hr. has been used as electricity or power cost, if this is 1 cent in plant under consideration then this figure should be substituted. Likewise other values may be converted to actual ones for an actual local condition. It is believed that the values used in this table are fair and represent well averaged conditions, and they may be considered directly without substituting for local conditions, in fact, in their direct form they allow of judging correctly of the general problem of electric vs. fuel fired furnaces.

Final

In conclusion permit me to present chart No. 1, made up from the other curves and tables. Here I have assumed that all the brass in the country is melted (1) in fuel fired furnaces, all types being employed equally, (2) that the same work is done in the electric furnace.

Four conditions are shown, viz.:

10-hr. day (1) melting yellow brass, (2) red brass, 24 hr. day, (3) melting yellow brass, (4) red brass.

The shaded portion of each wedge

Continued on page 12

Various Examples in the Art of Gauge Making

To Make a Good Gauge Necessitates Considerable Skill. Herein is Shown Various Examples of This Interesting Branch of the Machine Tool Industry

By H. G. ROBSON, A.M.I. Mech. E.

GAUGE-MAKING, the most highly skilled branch of engineering, should be a very interesting study to all students of engineering. It reveals an interesting amount of geometrical and mathematical knowledge, and a skilled worker, having acquired the latter, must necessarily possess an advantage when undertaking the design or construction of difficult types of gauges.

The following examples of gauge-making are more or less of a straightforward kind, and they have been chosen to reveal the modus operandi of the gauge-maker rather than the extent of calculations required. Nevertheless, these examples show many neat devices for executing work that may be generally regarded as difficult. In Fig. 1 a plate gauge is shown with a limit of ± .0005 in. In order to appreciate the beautiful principles of "limits," the nominal sizes, as given, should be worked to. The first step is to make a hob, as in Fig. 2, by which the gauges can be gashed or roughed out. To allow for distortion during the hardening and tempering of the hob all the diameters of it must be made so as to make the depths of the semi-circular parts of the gauge greater, and the width of the slots less than the nominal figure. A small plate gauge would have to be made, as in Fig. 3, for making the semi-circular portions of the hob. The hob is made hollow, and the outer ends of the hole are tapped for securing to a suitable holder. A portion is then ground away, so as to leave a face F radially, as in Fig. 2. If the hob is correctly made the cutting face will be a section plane passing through the centre.

The check piece must now be made to finish the gauges by. It is shown in Fig. 4, marked C, and its application to a gauge G is shown. When the gauge is finished, the surfaces of the check and gauge should be light tight. This test is made by placing the two parts in Fig 4 against a piece of glass, holding them to the light. The check has two pieces, marked 1, fitted into two slots, and securely held in the same plane to the body of the check by a cover plate. The two curved pieces must project above the body by $.082 + \frac{.15}{2} = .157$ in. The body of the check must therefore be made parallel to a measurement, say, 1 in. By measuring from the lower edge the micrometer should read 1.157 in. as shown. Considerable skill is required to make a check of this type. It is very rigid, and by modifying the cover plate with slots, the pieces 1 could be raised to give various heights above the top edge. The check should be a good fit to the gauges before they are hardened, otherwise it will be found difficult to secure that the surfaces are light tight.

The gauge in Fig. 5 reveals exceptionally interesting work. The check will appear as in Fig. 6. There are two pieces A and a third piece B securely held in the body of the check. Having decided upon the design of the check, the first step will be to find the breadth b, Fig. 6, of the piece B. In Fig. 7 the particulars are set out. We have

$1.05^2 = .689^2 + w^2$,

$\therefore w = \sqrt{1.05^2 - .689^2}$,

$\therefore w = .792$ in., and breadth $b = 1.584$ in.

It will now be necessary to make piece B, and it is important to have the two sides equidistant from the dotted centre line in Fig. 6. A disc—Fig. 8—is bored and lapped to 1.05 in. radius. A circular plate is then turned and lapped to 1.05 in. radius. A segment is then made from this disc so that its height, 1.739 in., corresponds to the one edge of piece B of the check. By applying a straight-edge to the faces in Fig. 8 observations may be made for final testing of these faces. The piece B is cut from the disc, and its width 1.548 in. is worked up from the true face first determined. It will now be necessary to true the bottom face square with the sides. The heights of pieces A of the check must correspond to the height A in Fig. 9. There is danger in working from this sharp edge, and the actual height of A is best found by finding B. By holding a lapped pin, as shown, the height C is given, and from it B is found. Assume $B = 1.14$ in., then $A = 1.14 + .361$ in. (Fig. 7) $= 1.501$ in., which is the measurement for the two pieces A in Fig. 6. Finally the overall heights in Fig. 6 must be checked from the base, because the inner face of the check is .4 in. and parallel to base. The top face, marked by measurements D, is then made so as to permit pieces A to project by .55 in. These pieces must be rectangular and fit tightly in the body of the check.

Interesting principles are embodied in the gauge shown in Fig. 10, which represents a plate gauge of three sizes, having the .43 in. measurement out of centre by .0015 in. The plate should be made parallel as in Fig. 11, so that A C and B D are 1.235 in. The faces shown by the dotted lines are then parallel to A B. The first measurement will be

$\frac{1.235 - .721}{2} = .257$ added to $.721 = .978$ in. The last size is $\frac{1.235}{2} + .0015 + \frac{.43}{2} = .834$ in.

The widths, .721 in. and .43 are then made from the true faces. As distortion may follow the hardening process, a check must be made so as to secure centrality of the first two sizes, and the amount of eccentricity of the .43 in. width. The check is shown in Fig. 12 applied to one side of the gauge. By making a parallel piece of plate, say, .704 in. wide, the other size can be found to give the correct position of the faces. This check cannot be used for the opposite faces, but they may now be tested by using the micrometer to determine finally the respective widths.

The gauge shown by Fig. 13 includes much work that is typical of the tool room. It is no simple piece of work, and requires a great deal of skilful manipulation. The work, when released from the drill jig, will be near to what is required, and the allowance upon the diameters of the .122 in. holes will then permit them to be worked up to their size, pitch and amount off the centre line. There are two .122 in. holes at right angles, having a pitch of .36 in., and situated .004 in. off the centre line of gauge, and .331 and .691 in. respectively from one end face. It is proposed to use a jig for drilling purposes, as in Fig. 14. There are two bushes, A and B, for drilling in from one side, and two others for meeting these holes in the centre. The hole in the block should be gauge size, so that the gauges will be securely held by fitting tightly. The first step will be to make the faces C D, D E, E F, F C at right angles to each other and true and square with one end face. It will be necessary to have the edge of the square for testing in good condition, and it may be necessary to finish it off by oil-stoning. One face for measuring from is made at right angles to the axis of the hole by securing a gauge mandril in the jig block, as in Fig. 15, and testing. The next step is to find the position of the centre punch marks for drilling holes for bushes B. The block is lettered to show clearly the method adopted. First the height of the centre of the hole for gauges above the base F E is found. By using small plate gauges with a slight taper under the parallel mandril, as in Fig. 16, and adding the radius of the mandril to that measurement, the position of the axis is located. A counter check of this position should be made, as in Fig. 17. Place a small lapped pin in the hole, and by the micrometer ascertain measurement B. From this deduct the diameter of pin, and height A is found. This height added to the radius of the mandril should agree with the previous measurement. Let us assume that this height comes to 1.238 in., as in Fig. 16. As the hole is .004 in. off centre in

SKETCH SHOWING FIGS 1 TO 33.

Fig. 13, the height in Fig. 16 will correspond to 1.238+.004=1 242 in.

By the aid of a magnifying glass, and using a scribing block and steel rule, a line is marked at this height upon the end faces—that is, D E and C F. The position of the centre punch along this line in Fig. 16 is .443 + .36 = .803 in. from line G H. In Fig. 14 .004 in. are being allowed for finishing the end faces of the gauges, therefore the measurement becomes .807 in., and is marked off as in Fig. 18, but upon the two faces opposite each other. Here again a magnifying glass and a rule divided into hundredths of an inch should be used. Whilst the block is in the position shown in Fig. 18, a line for the pitch of the holes should be marked. The holes are .36 in. apart, therefore the next line will be .807 in. —.36 in. = .447 in. This height can now be marked off, but upon the faces C D and E F, at right angles to the faces, already marked. The face C D should then rest upon the face plate, because the holes now being dealt with are shown .004 in. off centre line in the plan of Fig. 13. This is important, for it is possible to secure that the .121 in. holes shall be .004 in from the centre lines, but by a slip the relative position of the slot may be incorrect. This effect can be better understood by reference to Figs. 19 and 20. Fig. 19 shows a plan of the gauge where the holes should be. In Fig. 20 hole 2 is shown drilled the other side of the centre line. If Fig. 20 is turned 90 deg. in a clockwise direction, the position will correspond with Fig. 19, but hole 2 for that position must be near the end where the slot is. If the gauges were not corrected at once they could not be saved, even if the ends, as it were, were changed over. The intersection of the marked lines having been marked by a centre punch, the mark should be re-examined by a glass to see its position more clearly, and any adjustment, if necessary, made. Four holes can now be drilled in from the positions on the faces. The diameter should be about .004 in. less than the finished size., viz., .117 in. The holes should now be enlarged by a pilot drill, so that there is about .1 in. of metal at the bottom of the enlarged hole. Bushes are turned as shown, their holes being .117 in. diameter. A slight lead upon the diameters of bushes is helpful. There is sure to be some adjustment necessary, even though accuracy has been the aim of the jig worker. By applying ground pins .117 in. diameter. it will be seen how the axes of the bushes are situated, and, finally. the pins should point correctly, be parallel to base as at A and H—Fig. 21—and be correctly set off centre .004 in. The gauges are 13-16 in. external diameter, but owing to precision required they are turned .8125 in. diameter. A segment piece about 2 in. long is then made to the shape shown in section in Fig. 21. Its thickness varies by .0005 in. throughout its length. Its mid-thickness will be.

$$\frac{.8125}{2} - \frac{.117}{2} + .004 = .40625 - .0625 = .34375 \text{ in}$$

This is the radius of the hole in the jig less radius of pin plus amount off centre. It will be found a little difficult to arrange the bushes so that their positions are properly situated, although in Fig. 21 the method shows that the bushes are located for position by measuring a reasonable distance from the centre of the jig. After all, it is the position of the pins in the centre hole—.8125—that really matters. So, while it is practically convenient to measure outside the jig, yet the pitch of the pins can be tried near the centre by placing in the jig a disc made the measurement between the inner surfaces of the pins. In Fig. 22 this disc D is shown resting between the pins.

Having made the jig correctly, it will be very necessary to turn the gauges carefully so that the .263 in. hole is concentric with the outside surface. As a matter of fact, one mandril for turning the gauges upon it is not sufficient. It is found during the roughing stage that the mandril springs, and often, if not hardened, take a permanent deflection It is therefore the better plan to remove th final .01 in. by using another mandril. It should be remembered that there are so many points that should finally agree when the gauges are finished that any small errors in the jig or in the preparatory stage of the gauge should be at once corrected. It is the cumulative effect of several little errors that often makes a straightforward piece of work an exceedingly difficult one.

The drilling will have to be executed by specially turned drills. A flattening drill is first used, a centre drill then follows, and then the drill .005 in. less in diameter than the centring drill makes the holes in the gauges. A series of pins, ranging from .004 in. less than the finished-size holes, by one-thousandth to .12 in., is now required. During the drilling stage the .263 in. hole should be plugged in all cases. After the gauge is drilled, one of the series of pins should be placed in the gauge. Then by means of the rimers the position of the holes are determined, as regards pitch and amount off centre. The distance of the end of gauge from pin is finally made by working the end face up, so that mandril M in Fig. 23 is square with base and the heights W agree. Having made one gauge carefully, a centre plug should be made so as to fit in the gauge upon one pin. The end face of this plug should be lapped so as to be level with the end face, as shown in Fig. 24. The end faces can then be determined by this plug more correctly than from the outside of the gauge. When one face is determined, the length of 1.134 in. can be made. With regard to the slot, it is necessary that the centre line of the .263 in. hole should coincide with centre line of slot, and the slot be parallel to the hole near it. By using the segment piece—as in Fig. 25—it can be calculated how wide the slip S will have to be so as to come to one side of the slot and fit in position. As soon as one side is finished, the slot is then made .156 in. wide by another slip. This arrangement also secures the slot being parallel to the hole near it. The slot is .011 in. deep. A gap gauge to fit over the slot and bottom of gauge is not a neat enough check. A better plan is to make a plug to fit inside the gauge so that it is (1.134 —.011) = 1.123 in. long. By inverting the gauge and supporting it so that the plug rests upon a level with slot—as in Fig. 26—the depth of slot can then be tested. The slot is .011 in. deep when the three surfaces S are level. The gap gauge mentioned would be 1.123 in. wide, and could advantageously be employed to test parallelism, whilst the depth is being worked up.

A different type of gauge is shown in Fig. 27. Here there are two .368 in. pins projecting .734 in. above the face of the disc. They are situated upon a centre line of the .965 in. hole. A groove .36 in. × .295 in. deep has its axis inclined at 27 deg. to the axis passing through the pins. The centre line of the slot is .082 in. off the centre of the .965 in. hole. The jig will consist of a ring—as in Fig. 28—having a .965 in. hole. When in use a .965 in. plug secures the jig and gauge for alignment. In making the jig, the holes are carefully marked off, enlarged and then bushed. By placing pins in the bushes —as in Fig. 29—the radial distance of centres can be tested by finding the measurement A. In addition, tests must be made for determining that the centre line of the pins passes through the centre of the .955 in. hole. The arrangement shown in Fig. 30, although used for testing the pin holes after drilling, can be used also for testing the holes in the bushes. Here the gauge is supported up against the true block M by a .925 plug and the face of gauge. The slip piece S is made to its correct size. viz.,

$$\frac{.965}{2} - \frac{.368}{2} = .2985 \text{ in.}$$

When the pin B is correctly situated on the centre line, another slip, the same size, must just fit—as is shown for pin A. In order, therefore, to determine correctly the position of the pin holes, the holes must first be drilled .004 in. smaller than finished size. This is not a large amount, since the gauge is .8 in. thick, and if the holes are not square it is possible this allowance may be used up without assuring that the holes are square to the face. In addition to this, the measurement corresponding to A in Fig. 29 must be noted, as the pin hole is gradually enlarged to its final size. The enlargement is done in steps by using pins varying by .001 in. The position of the slot must now be determined. We first require the depth of the segment in Fig. 31 included between the .965 in. hole and one face of the slot. This will be

$$\frac{.965}{2} - \left(\frac{.36}{2} + .082 \right) = .4825 - .262 = .2205 \text{ in}$$

This segment must fit solid with a .965 in. plug shown in Fig. 32, by removing the metal as indicated. By this means the segment will occupy its position in a better way than if it were

separate. To use the segmental check piece, first place the two pins in the gauge projecting from the other face, and set them square—as illustrated in Fig. 33. The gauge should then be rigidly fixed, whilst the plug with the segment piece is placed in and twisted until the face of segment is parallel and touching the 63 deg. face of a set-square. Lines should then be marked on the face of the gauge, each side of the .965 in. hole. This enables direction of the face of slot to be easily found. The width .36 in. of the slot can now be marked off. The slot can be milled and finally ground, the face for the segment piece being finished first. The depth .295 in. can be found by making the depth of metal under slot .8—.295 = .505 in. by the micrometer. The height of the pins, .734 in., is found by making a washer to slip over the pins, and .734 in. thick. The end of the pins must be level with the washer face.

WOMEN AND STEEL ROLLING

By L. P.

The introduction of female labor in the Clay Wheel Rolling Mill at Wadsley Bridge has created some interest in industrial circles because it has always been held that the tasks in the mills are beyond the capacity of women, besides being unfit for them to do in many ways. The work done at the Clay Wheel Mill is of an exceptional nature, and far from being typical of general rolling such as is carried on in the Sheffield district. Consequently the experiment, however successful, does not possess much significance, and is not likely to be extended. We learn that the women are merely assisting in rolling 50 lb. billets into rods, and the work changes but little. Moreover, it is light, and comparatively simple. The conditions, in fact, are quite unusual. The work at the other mills, on the contrary, is not only extremely laborious for the most part, but highly varied, being often complicated, difficult, and dangerous, whilst a good deal of it requires a great amount of skill. It necessitates the handling of heavy pieces of red hot steel—a task which no girl could perform, nor should be allowed to do so if she were able. Such conditions necessitate the employment of a staff capable of dealing with the heaviest jobs. People in the rolling trade do not admit the practicability of diluting labor in the mills with women, and, indeed, few of the shops could be adapted so as to enable women to work in them in decency, safety and comfort. Moreover, no one having respect for our womanhood would care to see females working alongside men in rolling mills, where the coarseness of the prevailing manners and habits is notorious. Where the conditions resemble those at Wadsley, however, women may be employed without evil results, but authorities on the subject declare that such application does not come within the range of practical politics. Steel rolling is essentially men's work, and some people even think it is scarcely white men's work.

DRIVING BELTS

By M. E.

Many lose power and waste fuel because their driving belts travel far too slowly. This is readily appreciated by observing that the power transmitted by a driving belt (in h.p.) is found by multiplying the speed of the belt by the working tension, and dividing the result by 33,000. In other words, double the speed will give twice the driving power, and three times the speed will give three times the driving power, and so on.

For heavy drives, such as those used in brickworks, for all the main machinery the belts should run at an average speed of between 3,000 and 4,000 feet per minute, the higher figure being regarded as high by many engineers, yet satisfactory if the pulleys are properly aligned and the belt is cut truly and well made. In any case, the makers of the belt will usually advise as to the best speed at which it will run, and this speed should be made use of in planning or altering the machinery. If this is attempted it will be noticed how far short some of the well-known brickmaking machines are in this respect. For instance, a grinding pan will usually do its work most efficiently when the upright shaft with the runners makes about 25 revolutions per minute. With crown and pinion ratio of 8.1 this means that the driving shaft or pulley carrying the pinion must make 200 revolutions per minute. Assuming that this machine is belt-driven, with a 4 ft. pulley, the belt speed would be only 2,500 ft. per minute, so that to get the best results from the belt a pulley 6 ft. in diameter would be required.

In driving some brick machines of the ordinary wire-cut type, it is customary to use 3 ft. driving pulleys which make 18 revolutions per minute, lamentable waste of power being thus lost by the belt being run at far below its most efficient speed.

The main drive is often correspondingly faulty, particularly if a rope drive is used. Under ordinary conditions a rope works best at 4,800 feet per minute, which, on a 20 ft. driving pulley corresponds to 76 revolutions per minute, other sizes of pulley requiring equivalent revolutions.

The speed of belts is easily tested by making a chalk line about an inch wide across the belt and noting how many times in a minute the line passes a given spot, which can be readily seen at the same time as the belt. The number of revolutions multiplied by its length will give the velocity of the belt. Another method is to count the number of revolutions made in a minute by one of the pulleys carrying the belt and multiply by three and one-seventh times the diameter of the pulley in feet; this method is, however, open to the objection that the belt may slip on one or other pulley so that the speed of the belt and the pulley do not coincide as they should do.

It will be seen that a study of the speeds of the different belts in a works is well worth very careful attention, and where the speed can be increased to between 3,000 and 4,000 feet per minute without undue alteration in plant the change will be well worth while. It should be noted, however, that merely to increase the speed may be undesirable as it may result in speeding up some of the machines, and this may lead to disaster. As far as possible the standard rates of running the various machines should be retained, the increased belt speed being used chiefly in reducing the coal bill.

It sometimes happens that a belt is run slowly because at a higher rate it would run off the pulleys; in such a case the machines should be put into proper alignment by adjusting the bearings carrying them and the relative shafting. To run a belt slowly merely because it runs off the pulleys is unwarranted waste in these difficult times, and it ought to be stopped at once, especially as the adjustment is usually neither difficult nor costly.

The use of too narrow a pulley or too small a belt, or the improper position of the pulleys relative to each other, may also cause serious loss of power and therefore need periodic attention, and a little time spent in checking the sizes of the belts and the speeds at which they run, as compared with the really best dimensions and speeds will be well repaid, because it will show clearly wherein money is unexpectedly lost.

THE ELECTRIC FURNACE

Continued from page 8

shows the saving in total cost between melting with fuel and with electricity.

This chart stated in words and figures is as follows:

Furnace	Alloy	Length Melting day	Working day	Per cent. savings over fuel fired
Electric	Yellow Brass	10 hours		100%
Electric	Red Brass	10 hours		80%
Electric	Yellow Brass	24 hours		110%
Electric	Red Brass	24 hours		700%

These margins of savings are of such magnitude that we cannot longer doubt that the electric furnace is destined to dominate the brass melting field.

ANOTHER DRYDOCK FOR THE ST. LAWRENCE

The Leclair Shipbuilding Company, of Sorel, Quebec, are about to commence the construction of a floating drydock that will have a capacity of seven thousand tons. This will be large enough to float most of the vessels using the St. Lawrence River.

The company is busy at present on the construction of six steel trawlers and six 1,300 ton capacity wooden schooners, fitted with auxiliary engines.

WELDING AND CUTTING

Various Jigs as Applied to the Welding Trade

Some Examples of Welding Jigs and Methods for Overcoming Distortion Are Taken Up by the Author, Who Presented This Paper Before the British Acetylene and Welding Association.

By B. S. MILNE

AS I have, during the past ten years, been responsible for the manufacture and repair of innumerable articles by the oxy-acetylene welding process, I felt it to be my duty, as a member of this association, to respond to our president's call at the last meeting, and volunteer to write this paper relating some of my experiences regarding these operations. I have also written it with the hope that I may be imparting some useful information to the members, and that it may produce a great deal of useful discussion upon these matters.

I have chosen as my subject "Some examples of welding jigs and methods for overcoming distortion."

In my opinion the questions of jigging and overcoming distortion are, so far as new work is concerned, so intimately connected with what I shall call "design suitable for welding" that I shall endeavor in my examples to point out what I consider are, and what are not, "designs suitable for welding."

In repair work the question of design does not arise; that has already been settled by the maker of the article. All the welder is concerned with is the problem of overcoming distortion, or rather fracture, sometimes a very difficult problems. In repair work every job must be taken separately, on its merits, and here the ability of the individual welder to foresee his troubles, and take the necessary precautions, plays a great part, whereas I contend that, to obtain cheap and efficient production, in new work, the draughtsman is the man who should do most of the thinking, and he should produce a design, which, if properly jigged, can be welded by any operator capable of handling the blowpipe.

Prior to the war most Government departments looked upon oxy-acetylene welding as still in a somewhat experimental stage, only to be used on work of minor importance.

A number of engineers also looked upon it with considerable skepticism. The exigencies of war have wrought a miraculous conversion, and some of these reformed sceptics have recently let their zeal, for having everything welded, outrun their knowledge of "design suitable for welding."

In this matter of design, a great deal of education is still required by designer and draughtsman before welding can attain its full scope of usefulness. The vast majority of draughtsmen have not served their apprenticeship as engineers in shops where oxy-acetylene welding was used, so that they do not know the most rudimentary principles of welding, and, therefore, when setting out to design an article which is to be welded, they produce a design which makes the article unnecessarily liable to distortion, difficult to weld, expensive to produce, and infinitely less efficient as regards strength than it might easily be.

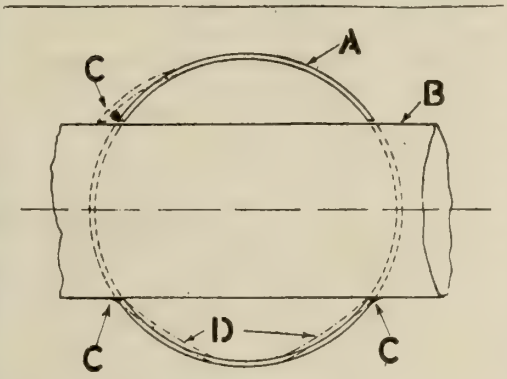

FIG. 1.

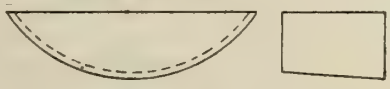

FIG. 2.

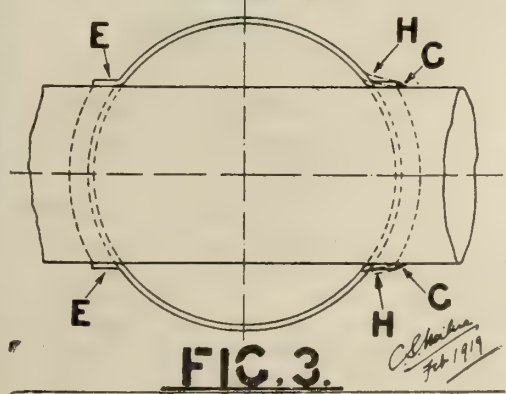

FIG. 3.

It is not my desire to try to absolve all welders from blame in the matter of failures in welded work, but in the manufacture of welded articles, in any ordinary commercial way, it is unfair to the welder to design an article which will require 100 per cent. efficiency at the weld, in order that it may have a reasonable chance of successfully withstanding the stresses which will be put upon it in prolonged use.

It is also unfair to produce a design which, in the very nature of things, must distort badly in the process of manufacture and then slang the welder for turning out an article which looks like nothing but a piece of scrap iron.

There is nothing so disheartening to the welder, or so likely to make him careless in the production of his work, as the feeling that, however much care he may exercise, he cannot possibly produce a really sound or nice looking job, because the design is such that distortion must take place.

Much can be done by jigs, but a jig which holds the article to shape at the expense of the strength of the weld is only meeting the trouble half-way, and producing an article, which, even if sound when leaving the shop, is likely to give way after a short life, owing to internal strains.

The function of the jig should be to hold the parts in the proper position for welding and at the same time to allow expansion and contraction to take place. It should not hold the parts in position by sheer force.

In repetition work I am convinced that money spent on jigs is money well spent,

and the design of simple and efficient jigs, in order to produce accurate work, often affords food for much thought, and is worthy of more attention than is usually given to the subject.

It is interesting to note, and augurs well for the future of the welding industry, that this association is not the only place where the merits of welding are being discussed.

Since our last meeting, and since I wrote the foregoing remarks, no less than four papers dealing with welding have been read before the Institute of Mechanical Engineers, three dealing exclusively with the oxy-acetylene system and the fourth with electric welding, the last by Mr. Thomas Heaton, of the Uxbridge Barrel Co., who probably has as wide a knowledge of the application of all modern methods of welding as any man in the country.

Two quotations are, I think, very apposite, one showing that, even when discussing electric welding, the large sphere of usefulness of the oxy-acetylene process, in which we are specially interested, has to be recognized. He says: "The author holds no brief for any given system of welding, and in confining this paper to electric welding he does not intend to imply that gas welding produces inferior welds. Indeed, he is of the opinion that each known system of welding has its proper sphere, and that probably any given method may be best in its respectively most suitable application. The author uses oxy-acetylene welding, and has done so for many years before the war with satisfactory results."

Again, when discussing one of the arc welding systems, he says, "The work, however, must be designed to suit the process, and the process regulated to suit the work in order to be successful. Distortion due to the heat, or the effect of contraction, must be allowed for, especially on flat surfaces, and anyone requiring welded joints would do well to consult the welding expert before definitely deciding on the details of his design."

This entirely confirms my own views, but I have frequently heard the statement made that with arc welding no allowance need be made for contraction and distortion, so I am very glad to see this statement made by one who has employed electric welding for about twenty-five years.

The spheres of usefulness for oxy-acetylene welding are, I consider, larger than those of other methods, and can be increased and perfected if careful attention is paid to correct design, in order to overcome distortion.

In dealing with light sheet or plate welding, it is not possible to overcome distortion by heating the whole job during welding. This cure would probably be worse than the disease. It is, therefore, necessary to look to other methods.

In the early days of oxy-acetylene welding, owing to the distortion difficulty, even makers of oxy-acetylene welding apparatus, who were out to boom this process, continued to produce their generators with riveted seams. I well remember one of my own difficulties with the first generator which I produced welded throughout, and which will serve to illustrate my point as regards "design to overcome distortion."

Fig. 1 is a tube passing through a larger tube. The holes in plate "A" were cut about ⅛ inch larger than the tube, "B", which was to pass through in order that it might be easy to get it into place. The weld was made as shown at "C", with the almost inevitable result that on cooling, after welding, the contraction put a buckle in plate "A", as indicated by the dotted line "D". This was partly caused by the fact that "A", when heated, expanded outwards, and, instead of being welded in its true position at "C", was really welded on as shown at dotted line "C".

Now had I been sending this design out broadcast, ordering thousands off, I should have been in a fair way to causing brain fever among those dealing with the job.

The same example will serve to illustrate my point regarding the unfairness of expecting 100 per cent. efficiency in the weld.

The makers would, in all probability, have said we must make a jig, something like Fig. 2, to wedge in and stop this buckling, with the result that the weld would be put in severe tension while cooling. The probable outcome would be that a number of the articles under test would show porosity in the weld, or cracks in or just alongside, the weld. The design is, therefore, undoubtedly effective and must be modified if good work is to be produced.

After various trials the design shown in Fig. 3 was adopted. Plate "A" was flanged, as shown at "E", and the weld made at "G". Dotted line "H" shows how the contraction after welding is taken up. This overcomes the difficulty of buckling and so entirely eliminates the strain that no buckling takes place, and jigs are not required. It is, therefore, I consider, a sound design.

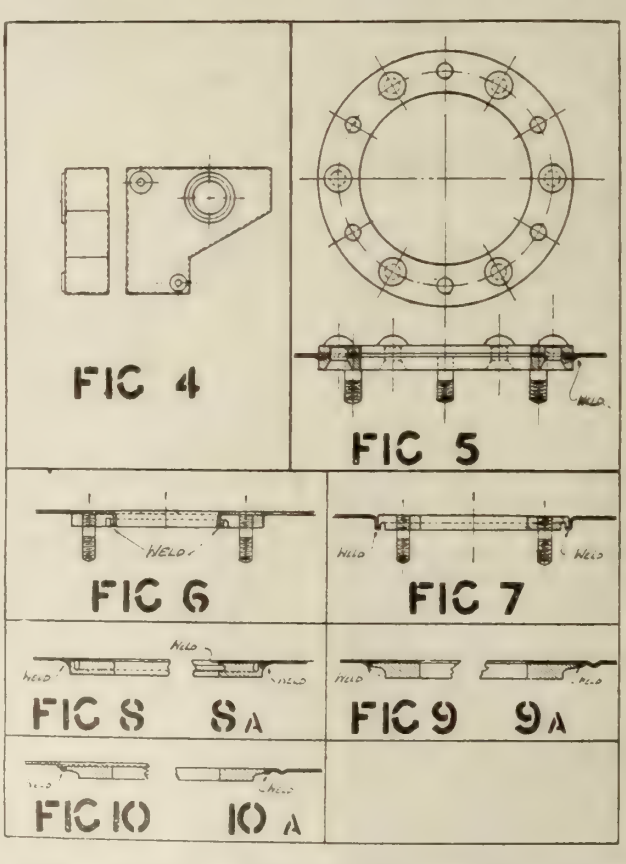
Fig. 4 is an instance of a type of design one frequently meets, a tank of ⅛ inch plate with flat sides having several pads for pipe connections, hand holes, etc. In this case it was specified that these pads were to be riveted and welded on. The weld was indicated as in Fig. 5. Now my objections to this are:

1. That I consider it bad practice to weld and rivet the same joint. If riveting will make a sound joint why weld? On the other hand, if it is necessary to weld to obtain a tight joint, why put in rivets, which will, in all probability, leak sooner or later?

2. I defy any welder to make such a weld as that shown in Fig. 5, because the penetration under the flange is shown about ⅝ inch deep, and the width of the "V" at the top, 3-16 inch.

3. The design of the flange is quite unsuitable for welding to a flat surface and must be greatly modified if successful work is to be obtained.

The weld could, in my opinion, only be made at all by employing a second blowpipe of large size to heat the thick flange while one man did the welding; otherwise the ⅛ inch plate would be burnt



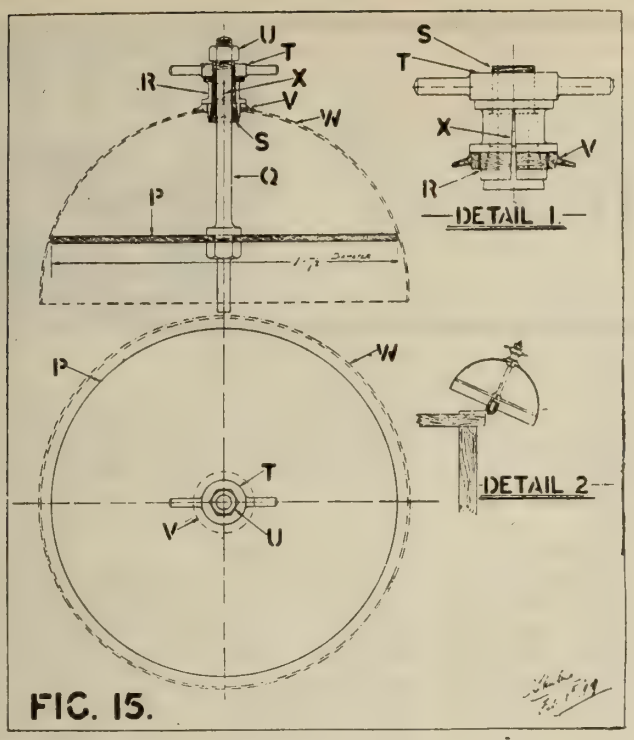


FIG. 15.

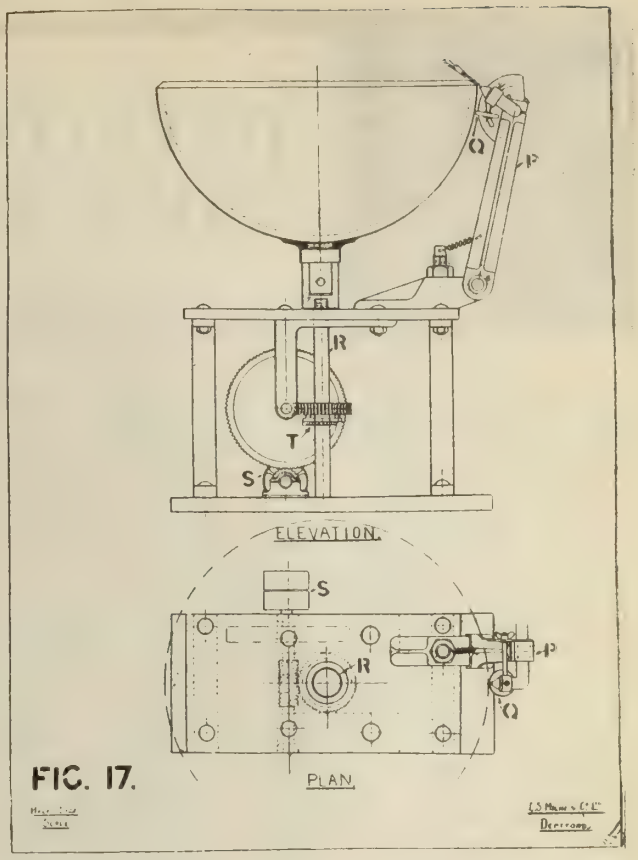

FIG. 17.

before the thick flange became hot. In any case the result would be an enormous strain on the weld, and the flat side of the tank would be distorted, so as to look like nothing on earth. This would not be due to any fault of the welder.

Several better methods, which might have been substituted, are shown in Figs. 6, 7, 8, 9 and 10. I am sure one of these could have been used, and would have been quite suitable, for the purposes for which the tank was required.

It may be urged that by riveting the plate between two rings, as in Fig. 5, greater strength is obtained than by the welding only, but I contend that the weld on the outside of the heavy flange would put such internal strains on the plate that if fracture were to occur it would be at this point, so that ring rivets would all come away together.

By flanging the plate and grooving the ring, as shown in Fig. 6, the edges to be welded are of equal thickness and a good weld can be easily made. No distortion of the thin plate takes place and no stresses are set up by welding. The studs can be taken right through the ring without fear of leakage. It has, however, the disadvantage that if a faulty weld be made it is almost impossible under test to locate the position of the leak. Fig. 7 overcomes this last objection and is stronger still, owing to the greater area of the weld, but there is danger of leaking at the studs if these are taken right through the ring.

By grooving the outside edge of the flange, as shown in Fig. 8, a weld of similar appearance to Fig. 5 is obtained while the stresses in the flat plate are to some extent reduced. By also grooving the inner edge, as shown in Fig. 8a, a seal is obtained if studs are taken through the ring.

By thinning the edge of the flange, as shown in Fig. 9, the welding is simplified, but will leave considerable stresses in the weld and surrounding plate. If, however, a corrugation can be stamped in the plate round the flange, as shown in Fig. 9a, it relieves the stresses and makes quite a sound method, and it can be combined with an inside weld, as in Fig. 8a, if desired.

For some purposes the methods shown in Figs. 10 and 10a are preferable. The radius (Fig. 10) or corrugation (Fig. 10a) relieve the cooling stresses, but careful jigging is required to keep the edge of the thin plate from buckling in or out during the actual welding.

The type of flange shown in Fig. 9, is very suitable for welding to spherical work or dished ends of vessels, as in this case the spherical end gives to the contraction by flattening.

I recently had to weld on to hemispheres a large number of screwed bosses. The method of welding is again as shown in Fig. 9. The difficulty experienced in this case was that the thread which had to pass fine limit gauges, distorted and required retapping. The heat slightly scaled the surface of the top threads and the life of the taps cutting this scaly surface was short.

Fig. 15 shows the jig used. In this job, I may mention, it was also essential that the thread should be kept concentric with the axis of the hemisphere. This makes this jig more complicated than would be required for merely preventing distortion of the thread.

The screwed boss "V" had to be welded to hemisphere "W." "P" is a circular plate with a pillar "Q" at the centre. "R" is a screwed bush bored taper inside and split, as shown at "X", so that it can be expanded. "S" is a tapered plug to fit "R" and bored a sliding fit to pin "Q." "T" is a fly-nut for drawing up the plug "S" in bush "R." "U" is a nut for holding the whole on to pin "Q." The hemisphere "W" is dropped over the pin "Q" and finds its own bearing on plate "P." The boss "V" is screwed on to the expanding bush "R" and this is then expanded by inserting plug "S" and tightening up nut "T," as shown in Detail 1. Several sets of these parts (Detail 1) are provided to each set of parts "P" and "Q."

The whole of Detail 1 is dropped on pin "Q" which ensures the thread being true with the axis of the sphere; nut "U" is tightened down lightly to keep the whole in position during welding.

After welding, by merely removing nut "U," the whole expanding device is removed bodily with the boss and hemisphere, and is left to cool while another part is put on pin "Q" for welding.

After welding, by merely removing nut "U," the whole expanding device is removed bodily with the boss and hemisphere, and is left to cool while another part is put on pin "Q" for welding.

The lower extension of "Q" fits in a socket on the welding bench, as shown in Detail 2, which holds the work at a convenient angle for the welder, and makes the whole easy to swing round as welding proceeds. This is very useful, as, in the case referred to, the jig and job weighed something well over one cwt.

It was found that, if the expanding bush is left in position till the work is cold, the thread is prevented from distorting and will pass fine limit gauges after welding.

(To be continued)

DEVELOPMENTS IN SHOP EQUIPMENT

INDEPENDENT-FEED RAIL DRILL

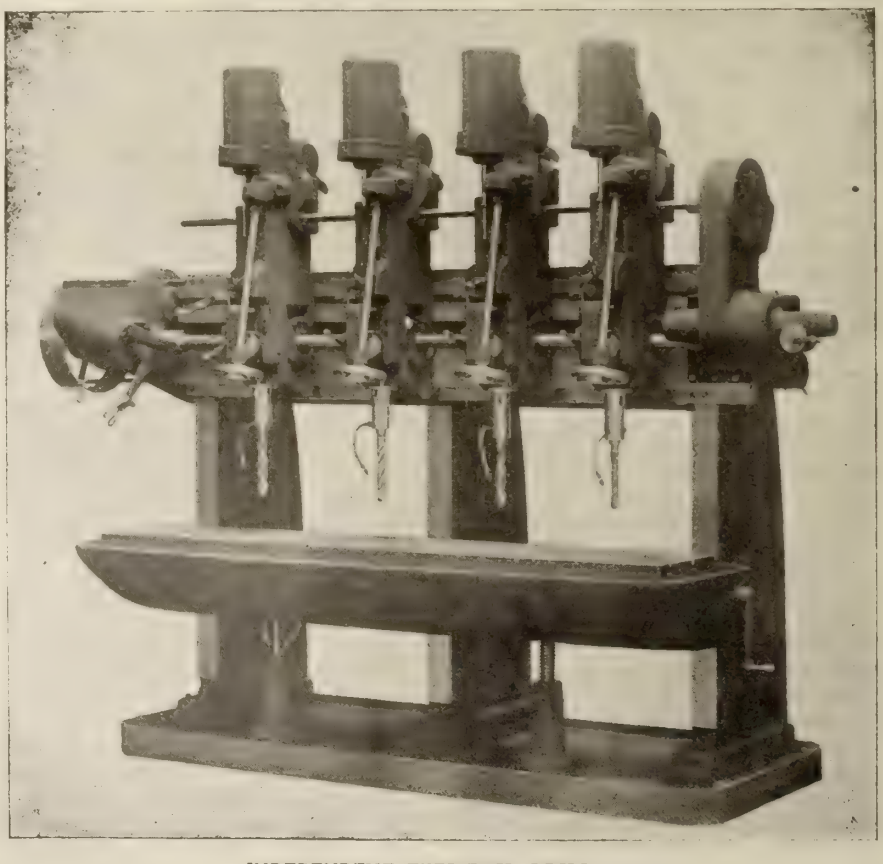
THE independent-feed rail drill, with independent heads, as shown in the illustration, is a heavy service production tool, and, though especially intended for use in locomotive and railway shops, gas engine and automobile factories, it will also serve efficiently in all kinds of general machine shops where the work includes heavy gang drilling or heavy jigged drilling. When used on jigged work, the compactness of this drill enables one operator to keep a greater number of spindles—either singly or in groups—continually in operation, and, as a result, the operator is kept constantly reloading the jigs, while a group of drills is kept constantly producing. Only the most modern methods of machine tool practice are incorporated in the design and construction of this machine. The speed mechanism, feed mechanism, and each spindle head are of unit construction, and each unit is readily accessible without disturbing mechanism other than that contained in itself.

The speed mechanism is attached to the upper end of the upright at the left end of the frame. It consists of two cones of hardened steel gears, back gears, and a hardened roll-in gear. There are three gears on each of the two cones, which provide three sets of gears of a different ratio, and these three sets of gears, when used in conjunction with the back gears, allow six speed changes, which are selected by rolling the roll-in gear into mesh with the various sets of gears on the cones. The shafts in the speed box rotate in Hyatt roller bearings, and the drive shaft, which transmits the power from the speed mechanism to the spindles, rotates in combined radial and thrust ball bearings. Power is applied to the speed box through a constant speed pulley, and transmitted through a Johnson friction clutch, which is used to select the backgear.

The feed mechanism is tightly encased, and is fastened to the upper end of the upright at the extreme right end of the frame. The feed changes are obtained through two cones of gears which are driven by the spindle drive shaft. Each of the two cones is fitted with three gears of a different ratio, which allows three changes of feed for each spindle speed. The feed changes are affected by a slip key method, which is operated by an indexed hand lever. The feed is transmitted from the two cones of gears to the feed shaft through mitre gears and a worm and worm gear, with end thrusts taken by high grade ball bearings. A hand wheel is also provided for quickly advancing or returning each spindle.

The spindle heads are gibbed to a heavy cross-rail by a dovetail method. Each head is a self-contained unit, and is adjustable longitudinally along the rail by means of a crank handle which operates a rack and pinion mechanism. The spindles are made of a high carbon forged steel, and are driven by spiral gears with two keys extending from the gear through the sleeve and into ways in the spindle. The end thrust on these keys and spiral gear is taken by a large ball bearing, while the spindle thrust is taken by S.K.F. ball bearings. This smooth and powerful drive is located at the lower end of the head, which reduces torque in the spindle to a minimum. Each spindle is counterbalanced, and can be driven and fed independently of the others. The levers used to apply the feed and drive to each spindle are interlocking so that the power feed cannot be engaged when the spindle is not being driven. Adjustable stops are provided to automatically disengage the feed when the holes have been drilled to a given depth.

The table is a substantial box type casting which is adjusted vertically by means of a crank handle which actuates two jack screws through a worm and worm gear mechanism. These jack screws support the table and maintain its original true alignment by receiving the thrust of the cutting tools on a direct centre line with the spindles. A cored section of the tables serves as a reservoir for the cutting compound, and the table casting is shaped on all four sides so as to form a trough in which the cutting compound flows back to the reservoir. The pump, which forces the cutting compound to the work, is fastened to the upright at the left of the frame and is driven directly from the countershaft.



INDEPENDENT FEED-RAIL DRILL.

The oiling method, which consists of a force feed, gravity flow and splash system combined, is made possible by the all-enclosed unit construction. The speed mechanism, feed mechanism, and each of the spindle heads are provided with independent and self-contained oiling systems which eliminate the human factor in the care of this machine, insure positive lubrication and economical maintenance. The contents of each unit is partially submerged in a bath of oil, while the bearings are lubricated by a force feed through individual leads which carry a sufficient flow of oil to flush all enclosed parts on its return to the reservoir.

This machine described is manufactured by the Defiance Machine Works, Defiance, Ohio, and following are its principal specifications:

Specifications

Capacity in solid steel, 2 in.; maximum distance nose of spindle to top of table, 32 in.; centre of spindle to face of column, 12.2615 in.; minimum centre to centre of spindles, 8 in.; maximum centre to centre outside spindles, 78 in.; length of power feed, 12 in.; table, working surface, 20x98 in.; table, vertical adjustment, 12 in.; speed changes, six, 25, 38, 58, 80, 122, 186 r.p.m.; feed changes, 3, .006 in., .009 in., .014 in.; diameter of spindle nose, 3 in.; diameter at driving point, 3 in.; diameter of spindle sleeve, 4 in.; morse taper in spindle, No. 5; drive pulley, face and diameter, 20 in. x 5¼ in.; drive pulley, speed, 350 r.p.m.

DAVENPORT NO. 2-B PLAIN MILLING MACHINE

The Davenport Manufacturing Co., of Meadville, Pa., has recently placed on the market a new type of plain milling machine, listed as No. 2-B. It is furnished with back gear drive, thus offering great efficiency under maximum load. The machine is pleasing in design, compact and rigid when in operation. The table has a surface of 38x10 inches, with a working range over its entire length and breadth. The longitudinal movement of 23 inches is automatic, and is obtained through gears and a feed screw of 4 threads per inch. Provision is made for a quick return of 1¼ inches per turn of crank. The cross movement of the table is 9 inches, and a vertical adjustment of 19 inches is provided.

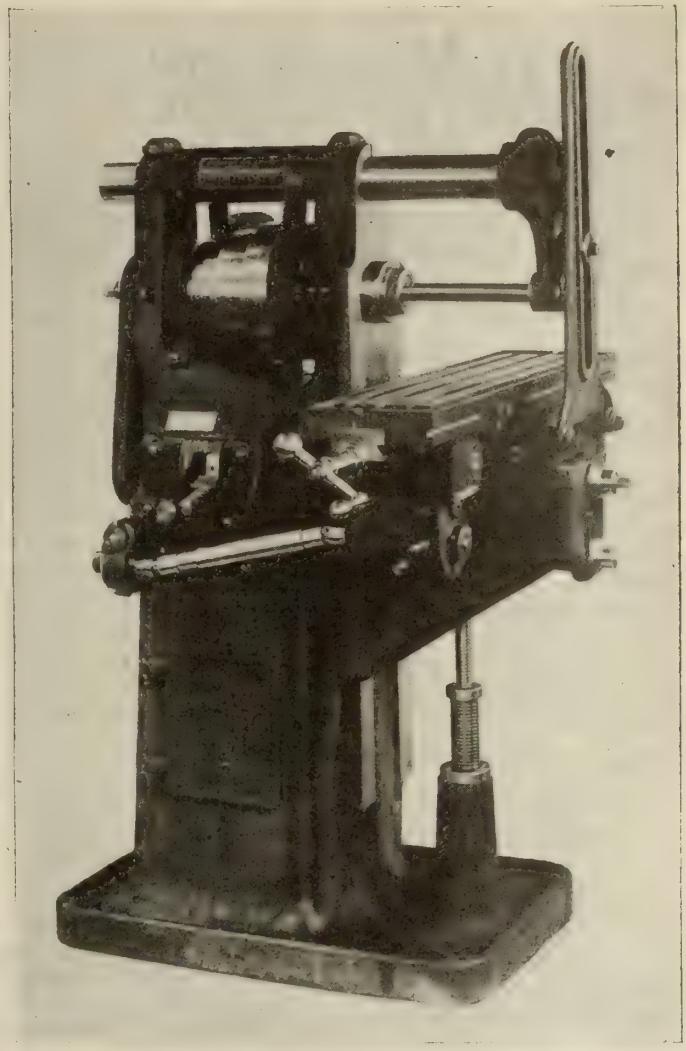
Table bearings are extra wide and the top is provided with three ⅝ in. slots.

The spindle is made of forged crucible steel and runs in phosphor bronze bearings, easily adjusted to wear without removing the spindle. The front journal is 2½ inches in diameter and 4¾ inches long. The nose of the spindle is 2¼ inches in diameter, threaded 10 threads per inch, R.H. The hole through the spindle is 11/16 inches in diameter and the front end is bored to receive a No. 10 B. and S. taper socket. Spindle thrust collars are hardened and ground, and ample lubrication is assured through large oil reservoirs located in the housings.

A three-step driving cone is used, with diameters of 7.73, 8.86 and 10 inches, adapted for 2¼ in double belt. The ratio of the back gears is 4.57 to 1. Twelve spindle speeds are provided, in geometrical progression: 20, 27, 35, 45, 59, 77, 95, 123, 160, 204, 270, and 350 revolutions per minute. Change gears are self contained and located in the bed of the machine. Twelve feed speeds are provided, ranging from .004 to .047 inch per revolution of the spindle. All feed gears are made of a special alloy steel, the drive from the spindle being obtained by means of a roller chain. All feed changes are obtained through three levers, while the reverse is made by a push rod located on the feed box. All working parts of the machine are oiled from the one main reservoir in the column. The feed tripping mechanism is of the plunger type.

The overhanging arm is made of special steel, and is 3¼ inches in diameter, its under side being 6⅜ inches from the centre of the machine spindle. The arbor is made from .70 carbon, chrome nickel steel, heat treated, and having a diameter of 1 inch, and a length of 10 inches between the shoulder and the nut. The outer end is supported in special design ball bearings. Dials on the feed screws are all adjustable, and graduated to register movements of the slides in thousandths of an inch.

The countershaft is adapted for two speeds, 123 and 270 rev. per min. Clutch pulleys are self-oiling, 10 inches diameter and 3½ inch face. Shaft is 1 9-16 inches in diameter and runs in self-oiling bearings. Vice, end braces and other accessories are also furnished. The extreme floor space occupied is about 48x74 inches, and the net weight about 1,900 lbs.



DAVENPORT PLAIN MILLING MACHINE.

RE NEW EQUIPMENT

It is our intention to make this section more interesting than ever before, and we would ask the various firms throughout the country to co-operate with us in this regard.

Immediately you have a new line or new addition to your line, send us photographs, or better still, electros or half-tones of the new departure, together with descriptive matter, after which we will do the rest.

In this way our section will prove of more value both to the reader and the manufacturer, for we will then be able to publish promptly these new lines as they come on the market.

When we receive electros or half-tones we can, of course, publish the matter more promptly than if we have to make our own cuts.

Something Better Than a Strike

THE sympathetic strike in Winnipeg has been called off. This should not be regarded in the light of either victory or defeat for capital or labor.

It must be taken as nothing short of a challenge to both parties to set to work to build up conditions from the Winnipeg mess that will make such an event out of the question again in this country.

The manufacturer, or the employer of labor in any capacity, might as well face the conditions. These new conditions are here, and they show no signs of picking up and moving out.

The personal element—the human side of the shop business—is coming to the front. The wise employer is going out and meet that new element half way. The fool hirer of men may slam the door in its face. By so doing he is going to nurse trouble and fall into the rear end of the industrial procession.

The manufacturers in many places are catching the vision. In some cases the light is taking a fairly long time to break through.

That big wall that has been built up between the shop and the office, between the firm and the employees, has got to be battered down. Not all at once. Such an attempt would spell failure at the outset. But little by little, pulling down a brick here and a tier there—gradually putting that bogey barrier out of existence. It is a big job and a hard one, but the very fact that it is hard and big make it attractive to men who like to tackle worth-while propositions.

CANADIAN MACHINERY has discussed this matter with men who have much to do with the framing of conditions under which thousands of men work. There is a new feeling in the work. It may be a result of the war—it may be a desire to give a square deal to men who risked everything at the front—it may be on account of pressure from industrial unrest—take what reason you wish, but the bare fact remains that there is a greater realization than ever before that the man in the shop must come more than ever to the front. He must not only have his labor power for sale, but the management is coming into the market now to get the good-will of the man as well as his ability and his muscle. The firm that gets its men—their ability, strength, enthusiasm and good-will—gets the real thing in industry.

There is no reason for the men to regard this new movement with disfavor. There is nothing in it that fights their views on unionism, or interferes with their affiliation with any legitimate trades or labor organization. The men should meet it with an open mind. Don't take the prejudiced view that the company is trying "to put one over."

There has been too much bitterness during the past few months. It is not going to get the employers or employees anywhere, except in a heap of trouble. Every question has two sides, and on neither of these sides can all the right and virtue be corralled. If these two parties are not prepared at this or any other time to sit down together and talk calmly, honestly and candidly about THEIR business affairs, then the future for both is poor and black.

This is not a time to harp or gloat over the success or failure of the Winnipeg general strike. It was a nightmare and a mistake. The big thing now is not to glory in post-mortems over that event. The great task is to set determinedly to bring about conditions in this great country that will draw a straight and clean-cut line between the legitimate complaint of a worker and the machinations of the agitator who makes more money on strike than at work.

CANADIAN MACHINERY believes that RIGHT NOW is the time for these things to take root and grow. Employers who look ahead can see the new era in industry coming. The old period of master and servant, of lord and hireling has gone. Don't struggle to make yourself believe that it will return. It will not and you would not bring it back if you could.

The new industrial era is here. The wise man is going out gladly to meet it and take it into his organization.

Amateurs and Experts

THE editor of the Toronto *Telegram* was called to Ottawa a few days ago to appear before the Commission that is now investigating the high cost of living, or simply the cost of living, because it would be poor business for anyone connected with a Government to say living was too high.

The Toronto editor and the committee had a real session. It was no parlor meeting, accompanied by the tinkling of tea cups or the trickling and dripping of soup.

They all went out into the backyard, left their smocks, caps and trinkets on the steps, and set to.

Many things were said. Even the sergeant-at-arms, who is supposed to play the part that an Indian plays for a cigar store, was wheeled out to look through the knot-hole while the game was on.

When it was all over the yard was badly mussed up and the committee and the editor were all ready for a spell with the clay dab in the shade of the wood-pile.

The cost of living hadn't been brought down—not a dent made in it, but there had been one single, lonesome truth that stuck up like a sore thumb.

It was tossed in by J. R. Robinson, editor of the *Telegram*, when he said:—

> "I stated an obvious truth that a committee of amateurs cannot examine an expert."

There have been more committees at Ottawa at times than they have had rooms to put them in. When they got tired calling them committees they changed the shingle to read "commissions."

And these committees or commissions have proceeded to spade up the garden lot for facts that should be gone after with a derrick and a stump puller.

In fact, it might not be a bad idea for some of the handy men they have choring around the Ottawa House to carve a bit of a sign and nail it on the door of the investigation chamber:—

"A committee of amateurs cannot examine an expert."

The Investment Buyer

THE markets are waiting for the coming of the investment buyer. He has been out for some time, and any sign of his return would be welcome news.

The investment buyer is a fairly long way removed from the hand-to-mouth purchaser. The former sits down and figures that he can find a market for something. That something may be goods for export, may be office space or hotel accommodation. His buying represents an investment, a tieing up of money against which he will have to work for some years to come. The hand-to-mouth buyer is a different proposition. He gets in a job and he buys the material necessary to see it through. What he puts into the work can hardly be called an investment. He simply puts his money in and collects it all in a short time from the buyer of his work. The market cannot run on this man's business alone. It does not give the necessary stability. It does not produce the large orders needed to get capacity output at the mills, without which production costs cannot be brought down.

The investment buyer hesitates to come into the market. He has had a list of reasons for not doing so that are a yard long. After war conditions, price-fixing and one thing after another have been grabbed up and gazed upon as bogey men to keep him from the market.

The signing of peace has been the last big consideration. For months it has been bolstered up as the last defence behind which the should-be buyer has squatted.

Now this may be taken away from him by the few strokes of a pen.

The market needs the investment buyer. He has been out of commission for a long time, although he has been making all sorts of motions that he is about to return.

Let him come. The hand-to-mouth chap has been doing fairly well, but he has his limits. Lead in the investment buyer.

Not All Profiteers

THE investigations that have gone on at various times in Canada into the charges of profiteering have brought two parties to the front, namely, the investigator and the party investigated.

A third party should be taking a hand in the interests of the great body of Canadian manufacturers.

The word profiteer is being hitched to-day by inference and association where it does not properly belong.

There are firms that made money out of war contracts. If they made too much it is up to the Government to get it away from them.

There are other firms that would have been better off by thousands of dollars had they never seen a munitions contract.

There are concerns that made money during the war years. The Government got a goodly share of it. At the close of the war they were left with thousands of dollars' worth of stock that had nothing but scrap value the day fighting ceased. There was no come-back for them. This year they are going to have a financial funeral.

Canadian manufacturers, in their own best interests, should see to it that no commission gets a chance to tag them as a body of "profiteers."

Don't be a Tinker

DON'T be a tinker. If you are going to do anything in life, do it well.

Do one thing better than any person else can do it.

Ever see a handy-man? You know the kind. He's not particularly skilled at anything particular, but he can catch on quickly. He makes a great stop-gap in the shop—and he generally sticks right there.

Ever meet the chap who can play a few chords on the piano, and who can sing a couple of old songs to his own playing? He gets through all he knows in a few minutes, and if he has to do anything more, he's up against it. As a matter of fact, he's only a tinker. He can neither play nor sing, and yet he imagines he can do both.

You have seen the average clerk in operation in a store. No matter whether it's groceries, dry goods, boots and shoes. In a general way he can get you what you want if you have a pretty fair idea of what you want before you go in. But he will never sell you anything else. He will never size you up as you enter the store, or as he talks to you as a prospective customer for some new lines of goods that the store carries or is going to carry. He is just an average, garden variety. In fact, he's a tinker in his line of business.

You know a machinist who can draw a little. He can make a rough sketch. He cannot make an intelligent drawing that would serve for a blue print. He's just a tinker, and as far as getting himself any place, he might just as well hold up his fist and own up to the fact that he can't draw at all.

Don't be a tinker. Do something, well—much better than any person else. Then there will be a demand for your services that will shove you head and shoulders past the tinker class.

The Stopping of a Car

IN what distance can you stop your car? Perhaps you have never figured it out, but others have. Providing the brake mechanism is in good condition and the road conditions are average, or in such condition that the tires can grip, the following table is given:—

At ten miles an hour you should stop in 9.2 feet.
At 15 miles, in 20.8 feet.
At 20 miles, in 37 feet.
At 25 miles, in 58 feet.
At 30 miles, in 83.3 feet.
At 35 miles, in 104 feet.
At 40 miles, in 148 feet.
At 50 miles, in 231 feet.

TORONTO has had a street car strike for over a week. Of course, there have been some cases of inconvenience. The remarkable thing is how well people have got along without the cars. The automobile age has provided a tremendous amount of transportation. Each year now will make it increasingly hard for a street car strike in any large city to inflict the inconvenience of ten years ago on the general public.

* * *

IT COSTS more now to get your picture painted than formerly. Still that is one form of dissipation that we can side-step and still have a fairly good time.

* * *

TO HEAR some Western grain growers talk on tariffs and Eastern profits at times, one might think the Westerners were right down to a shoe-string and nose-bag of wild oats. At the Ottawa inquiry it comes out that the Grain Growers earned 23 per cent. on a large capital, paid handsome salaries and bonuses and piled up a big reserve.

* * *

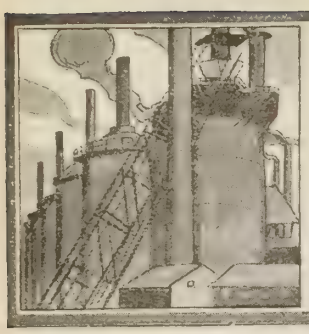
OCCASIONALLY one sees a stork in the Zoo, but there must be a stack of these things some place in the woods, for there were 1,352,792 births in United States last year.

* * *

A PENNSYLVANIA man named Hart got a quantity of maple syrup poured into his car instead of oil. And now we presume the neighbors will say, "There goes 'sweethart' for a drive!"

* * *

A CALIFORNIA man left $19,000 to his son. The only string is that the son has to earn $30,000 clear before he can get the $19,000. Chances are that by the time he piles up that sum he'll have cut enough wisdom teeth to know how to handle the smaller amount. It looks as though that fond parent knew a thing or two that the average chap never thinks about.



MARKET DEVELOPMENTS

Prices Stay Firm in Spite of Circumstances

Machine Tools Reports Say, Are Going to Move Higher in the Fall—Strike Is Giving Some of the Manufacturers a Big Problem —Greater Strength Shown in Scrap Market.

THE one surprising thing is the manner in which prices have been sustained during the months since the beginning of the year. In some ways it would seem that there has been nothing but monkey wrenches thrown into the industrial wheel, but the fundamental conditions remain firm.

Advices from the big machine tool centres hinted some weeks ago at a lessening of prices and greater discounts, but this is not borne out by reports that are coming through now, as indications are for higher prices for the better machines. Deliveries are only fair, indicating that in a good many cases the demand for machines keeps well ahead of the ability of the shous to turn them out.

The same can be said of the price of steel. Rumors were plentiful that the withdrawal of the fixed price would see the price crack. It did not happen then, and it has not happened since although the price control and support has been withdrawn for some time.

As mentioned before in this report, the end of the strike in this district is much desired just now. There are serious problems facing some of the manufacturers. It may be that shops will close down for the rest of the year, if not for the winter as well, as the season has in some cases almost closed when the product could be sold to advantage. Large investments, running into hundreds of thousands, are tied up all the way from the molding shop to the shipping department.

Buying is not in large quantities in the warehouse trade, although some of the dealers are quite certain in their statements that they have no complaints about the amount of business moving. They look forward to better days, reckoning that in many instances these must come irrespective of circumstances. They know there are large buildings that must be gone on with, and the time when these orders will be ripe for conversion is drawing close.

Machine tools still come into competition with the large amount of war-ship equipment remaining in this country. The bargain hunter is present in the machine shop business just as truly as elsewhere, and the "price" has a lot to do with the placing of business.

THE STEEL MARKET WAITS FOR THE RETURN OF THE INVESTMENT BUYER

Special to CANADIAN MACHINERY.

PITTSBURGH, Pa., July 3.—The signing of the peace treaty is expected to bring out a great deal of additional demand for steel. It is pointed out that a great many construction projects, involving the consumption of steel, have undoubtedly been held back, as a matter of general policy, to await the actual signing of peace. It was the common appraisal of the future of business, before the armistice was signed, that business of all descriptions would be stifled to a greater or less extent during the interim period between the cessation of hostilities and agreement upon peace terms.

The demand for steel in the past few months, when analyzed in detail, has shown clearly the distinction between two classes of orders, those that involved ordinary everyday consumption of steel and those that involved investments, such as can be made or postponed according to the judgment or whim of the investor. For example, there has been an excellent demand upon the pipe mills for "oil country goods" because oil is high priced and there is a continuous demand for it, but there have been practically no projects involving the laying of long oil lines, such as are regarded as of an investment character. Again, there has been an excellent demand for nails, which are used in common everyday life, while there has been little demand for structural shapes, which are used for building factories, skyscrapers, and bridges. A comparison like this might be carried to great length. The investment buyer of steel is expected now to be a much greater factor in the market than in the past few months.

Some Demand Increased

A further improvement is reported in the demand for sheets. Having operated at about 60 per cent. of capacity in May, the sheet mills operated last week at fully 75 per cent. This week there is some idleness on account of the holidays, the time being propitious for making repairs. One plant, the Deforest, at Niles, recently acquired by the Republic Iron & Steel Company, is down for the month, installing an electric drive. The steam plant is abandoned and current will be purchased from a public service corporation, although eventually the company may carry current from its main plant in Youngstown to the newly acquired plant.

There has been improvement in demand for butt weld pipe, which is now running at a rate of about 75 per cent. of capacity, while lap weld departments of the pipe mills, chiefly by reason of the heavy demand for oil country goods, are not only operating at capacity, but are filled quite solidly with orders for a couple of months to come.

In merchant bars there is improved demand, though the total is still far below mill capacity. Plates continue to present an extremely sluggish appearance, although perhaps the appearance would not be so bad if there had not been such a large increase in productive capacity in the past two years.

In addition to the 200,000 tons of rails recently purchased, the Railroad Administration will probably buy 300,000 tons, which will round out its requirements for the year.

Prices Firmer

Price cutting has not disappeared from the finished steel market, but there is less of it, apparently, than 30 days ago. The important feature, however, is that there has been price cutting for so long a time without its pulling down the general market level. The market has displayed an inherent strength that was hardly expected of it. Earlier in the year the philosophy of the mills was, in substance: "Let us hang together, so that we do not hang separately." Price cutting, it was then thought, would cause the bottom to drop out of the market. Accordingly, it was very unpopular to cut prices, but of late there have been several lines of finished steel product in which a mill could have felt free to cut prices, if it desired, because it had so many examples to follow. In sheets, for instance, while the leading interest has adhered strictly to regular prices at all times, there was a time when probably 25 per cent. of the tonnage booked by independents was at cut prices. The proportion is now less. The Inland Steel Company, for instance, has withdrawn from the market entirely, being comfortably filled with orders. In pipe the irregularities recently far from uncommon have practically disappeared.

Pig Iron Steadier

Pickands, Mather & Company and M. A. Hanna & Company are each reported to have sold fully 100,000 tons of pig iron, chiefly foundry grades, in a period of 30 days. Other producers have also done well, and the merchant furnaces now operating, with perhaps an occasional exception, are now comfortably filled with business for the third quarter, with some tonnage booked for fourth quarter. As a result there is little disposition to shade regular prices, which are those of March 21, except where it has been necessary for individual districts to develop different levels in order to place their markets in normal trade relation with prices in other districts.

While the market has thus improved materially, furnacemen hardly expect any advance in prices to occur in the near future. They recognize that with so many furnaces out of blast the market would experience difficulty in advancing. The furnaces that went out of blast did so not because they wanted to be out of blast, of course, but because they wanted the situation to be liquidated. They did not want to take chances in trying to stay in blast by cutting prices, as there was no telling where prices would go in such case. Now, however, they are eager to get in blast again, and many of them would probably decide to blow in if they saw an opportunity to build up some backlog business for the start, even perhaps at the expense of cutting existing prices slightly. Thus while few are disposed to predict positively that pig iron will advance this year, there are many who express conviction that next year it will be above present levels.

Mill Operations

Steel mill operations may be estimated at a rate of 65 per cent. of capacity, representing a rate of ingot production of about 32,000,000 gross tons a year, capacity being about 49,000,000 tons. This compares with an average rate of 54 per cent. during May, while about the middle of that month the rate had probably dropped to about 50 per cent. Thus there has been a very substantial recovery. The present rate is approximately equal to the average rate in April.

Wage Scale Settlements

After making extremely strong demands in connection with the sheet and tin plate wage scales for the twelve-month beginning July 1, the Amalgamated Association has accepted some slight advances for some members of the crews, whereby the total of sheet mill wages is advanced 3.6 per cent. and the total of tin mill wages about 2.6 per cent. The settlement refers only to the labor at the hot mills. Less than half the mills are organized, but the non-union mills, with few exceptions, pay at least union rates, and some make a practice of paying just a shade more.

POINTS IN WEEK'S MARKETING NOTES

Scrap metal markets are much stronger this week. Large dealers report that Canadian foundries and steel mills are buying, which is the first time this has been reported for some weeks. Although prices have not been marked up in several cases the values are better than the price list indicates in Toronto. Montreal has advanced prices quite materially.

—

Cancellation privileges that went with some good sized orders for tubes were not taken advantage of, and the shipments were taken on. This may mean some news in regard to the settlement of the metal trades strike.

—

Machine-tool dealers report that they still come into conflict with the war shop machinery, of which there is considerable in the country yet. However, they are willing to admit that this is not nearly so serious as appeared likely at the close of the war.

—

New York reports indicate that prices on machine tools may be even higher by the fall.

—

Pittsburgh despatches state that the improvement in the production of the steel at the mills there is being sustained.

—

Strikes in the West have made matters pretty much tangled with the firms that have their head offices in the East. There had been no communication for some days and no express. Many of the managers and staff were away from business entirely, acting under instructions from the Committee of One Thousand.

—

Metals are stronger, copper being marked up again, with indications that third and fourth quarter deliveries may reach still better figures.

STRIKE PUTS END TO SALES THIS YEAR

One Firm Has Quite a Proposition as to Whether to Close for the Season

TORONTO.—The holiday coming in the middle of the week has a tendency to make it a short one for dealers, as many of their prospects take the week-end and the section of the week lasting over the holiday as well. Small sales are the order of the day. Not much business is coming out of the Toronto field at present, the strike, which has now lasted going on two months, being responsible for much of this. Those who were figuring on equipment are not going ahead until things become settled, and those who purchased equipment are rather tied up for want of production from it.

Big Decision to Make

One of the firms now affected by the strike is seriously considering what to do for the future. They make a line of goods that has a ready sale during the summer and fall months in the rural communities. When the war ended, they put over $200,000 in new equipment, and got in shape for going ahead, expecting to get production at the latest by the middle of June. The strike has tied them up, their orders have largely been allowed to slide, or they have farmed them out elsewhere, and their sales staff has been left with much less to do, adding to the overhead of the firm. For almost two months now over $200,000 worth of equipment has been tied up there all the way from the molding shop to the shipping room. The firm has not decided whether to shut down entirely for the season, as production later on now in the fall will be of no use to them for this year's selling.

Meet Competition Here

Some of the dealers claim that they are still running into the old war shop material when trying to dispose of new equipment. While this may be so, it has not proven to be the menace to the trade that was feared some time ago. The railroad shops, for instance, were

out with a big list some weeks ago, a large amount of which went direct to Bertram's at Dundas and the C.M.C. at Galt. The list was then sent to the old Ross Rifle plant at Quebec, which the Government owns, to see what material would be available there. Dealers had been figuring on getting a nice slice of that business, but they are not complaining, and are ready to admit that it is good policy for the Government to go ahead and use the material they have on hand.

The strike in the West has had quite a marked effect on some businesses here with branches there. In one case the manager of a big machine-tool house was out for weeks in charge of one of the fire stations, while the assistant manager was in the barracks training as a soldier under the Committee of One Thousand. No mail or express go through, and it will be some time before the affairs of that branch can be straightened out.

But no one comes along to say that business is poor. Willing to admit that it might be better, dealers are also unwilling to state that they have a serious kick to make. In fact the manager of one of the houses in Toronto stated to CANADIAN MACHINERY this week that their business was keeping up remarkably well month after month, and there had been nothing so far that looked like a slump.

One Cheerful Chap

CANADIAN MACHINERY ran into one chap who was all optimistic this week. He is in the scrap metal business in a big way. He was not at the point where his optimism led him to mark up prices, but he was quite willing to admit that it would come very soon, in fact values are a little better right now than the price list indicates, but it is not good to shove up the list for a few days and then lower again.

The scrap yards are selling a fair amount of material right in Canada now to the foundries and mills. This is the first week that any movement of this sort has developed to any extent. There is a better feeling in the market, and that hesitation that was so manifest for some time is largely passing away. There is a certain amount of shipping directed to United States points. More material is being offered for sale than for some weeks past. Dealers are willing to part more freely with some of their material, and transportation and other companies are sending fair offerings to the market. It all points to better days for the scrap market. They are well nigh due, as the second hand metal market has been a poor one nearly all the way through since the signing of the armistice.

Buying in Small Lots

Prices remain firm in all lines of steel. This is the general statement that is given out, but the fact remains that the firmness of the prices might not be quite so pronounced were a nice, good-sized block of business to show up on the horizon. There has not been enough big buying for some time to really tempt the market figures down, and there is a general feeling that if much buying starts now the price tendency would be in the other direction.

The railroads are still buying a lot of material, and some of the shipyards are coming into the market, too. These firms generally buy pretty well in advance, so it seems likely that it is for business just booked that the inquiries are now coming in. There are some orders in Toronto shops that were on the anxious seat for some days recently. There was a cancellation clause attached —tubes in one item referred to—and it did look as though it would be asked for. However, the firm has taken the goods all in and is in the market for more. It may mean that they intend to operate again shortly. Whether any solution of the strike is in sight that we have not heard about, is not known, but the fact that they are in the market in a fairly large way is a bright spot not to be overlooked.

Metals Are in Demand

There is good demand for metals this week. Some of the largest dealers claim that although there has been some loss of trade due to strike conditions, business is a long way from being seriously affected. Buying is very general in many lines and firms that have much call for copper later on in the year are buying quite freely now in view of prices that seem to point upward for the third and fourth quarter. There is no doubt, either, that the recent tariff is having some change in the price of copper.

Spelter is also stronger, and a little of its new strength may also be traced to tariff conditions and changes. It is selling now at $8.50 per pound.

"PEACE TIME" TRADE IN MONTREAL SHOULD MEAN BETTER BUSINESS NOW

Special to CANADIAN MACHINERY.

MONTREAL, July 3.—The signing of peace marks the close of an epoch of the world's history that many of us are glad to see come to an end. The future may not be all roses, but predictions are that a period of industrial activity will follow the depression that has been evident during the first six months of this year. It is generally conceded that the delay in the concluding of peace has been instrumental in the reluctant attitude of many manufacturers in starting on a campaign of reconstruction activity. This condition may now be replaced by keener interest on the part of business men and the way opened for establishing a reliable basis for future enterprise. This step may be aided considerably by the better tone in the strike situation, a factor that will, no doubt, assist materially in quickly adjusting the business and working relations between labor and capital. Steel is devoid of active interest and dealers here report a very quiet in fair volume, but general steel commodities are quiet.

"The high cost of living," stated one dealer, "is felt in more directions than those directly connected with home surroundings. This condition is naturally reflected in industry and conservative methods are the rule where enterprise is contemplated. Many circumstances are combined to restrict the reconstruction activity and time alone is the one factor that will solve the final adjustment of present unrest and unsettlement." Local strikes have been felt slightly, but have had little effect on current demand.

The belief still hovers about that peace settlement will act as a turning point, and that from now on business will show a steady return to normal. Price quotations in all lines are quite firm, and even with a strong undertone.

Steady Strength in Metals

Whether the signing of peace is responsible for the better tone of the metal market, or that the time is opportune for a better buying movement is a question of the hour, but the fact remains that dealers are disposing of more metal now than they have done for some time past. This is particularly noted in coppers and spelter, the sales of these metals having registered material increases. Copper is now quoted at 22 cents for lake and 21 cents for electro and castings. The tin situation is gradually adjusting itself, as the market is now virtually free from Government restrictions, as far as Canada is concerned. The supplies of tin are more plentiful and present requirements are normal, assuring ample metal for all possible early demand. Dealers here are quoting 55 cents for tin, a decline of one cent on the week. The stronger spelter market is responsible for an advance of ¾ cent in the quotation, this week's price being 9¼ cents per lb. Lead is also stronger on steady demand, the price quoted being 7¼ cents per lb. Antimony is firm on light demand. Aluminum is weaker with fewer sales; the local quotation is 36 cents per lb., a drop of 2 cents on the week.

Scrap Retaining Its Strength

Although the demand has shown no marked increase over the past few weeks, the strength of the old metal situation is well maintained and quotations are of a very firm character. The foundries are not buying as heavily as usual and only for immediate needs. The feeling, however, still exists that better times are in prospect before the summer is over. This is the impression of quite a number, and the reports from different quarters seem to verify this belief. The general movement of scrap is comparatively light, but what little enquiry is reported would imply a better buying of scrap might develop in a few weeks. Firmness is a feature as to prices and

what few changes are effective show a slight advance. Machine composition is quoted ¼ cent higher at 12¾ cents per lb. Medium brass is quoted at 7 cents, an advance of one cent over last week. Scrap zinc is selling better and the price asked is 5½ cents, ½ cent higher than a week ago.

NEW YORK MARKET PREDICTING HIGHER PRICES FOR MACHINE TOOLS

Special to CANADIAN MACHINERY.

NEW YORK, July 3.—Some manufacturers of machine tools predict that selling prices during the latter half of the year will be higher than those which now prevail. Labor costs show a tendency to advance rather than decline. Quite a few machine-tool builders have already received notice from foundries of higher prices for castings due to the demands of iron molders for higher wages and a shorter working day. Among machine-shop workers also there is an agitation for a 44-hour week without a reduction in pay, and if this becomes generally operative, higher labor costs will naturally follow. All indications at all events point to the probability that prices will not go lower, this year at least. Many users of machine tools who feel that they cannot afford to pay the high prices demanded for new tools are looking very carefully into the second-hand machinery market. A fair proportion of the tools from war plants are in pretty good condition, and the prices on this equipment are considerably lower than on corresponding new tools. The competition of second-hand tools is becoming a more and more serious factor from the standpoint of the machine-tool builder.

Conditions in the New York market continue only fair. There is no improvement in business, a fair amount of small orders coming in, but there are no large inquiries. While there is some disappointment that the readjustment from a war to a peace basis has been proceeding so slowly, the first half of the year has produced for many machine-tool builders a very satisfactory amount of business.

The John Wood Mfg. Co., Conshohocken, Pa., manufacturer of tanks and boilers, has acquired a manufacturing plant in Toronto and will purchase equipment there and in Philadelphia for the Canadian branch. Among the company's requirements are plate-working and pipe machines.

BUYING BETTER AND PRICES ARE SHOWING A TENDENCY UPWARD

SMALL advances in price are pretty general in the scrap market. These are not all based on actual trading, but in some cases reflect the feeling of optimism among the dealers. Following are the reports from U. S. points:

Chicago.—Feeling that there will be a buying movement by mills and foundries in the near future, dealers are bidding up prices on Government scrap offering. Advances have amounted to as much as $2 per ton. The Government has sold 17,000 gross tons of ingots at an average price of $19.

Philadelphia.—Dealers are showing no anxiety to sell heavy melting steel at present prices. They prefer to pile it in their yards in anticipation of an advance. Small sales of car wheels, low phosphorus and turnings have been made at prices a little higher than those on previous sales.

Birmingham.—Cast scrap is being sold freely, but heavy melting steel is being held by dealers for a better market. The tone is generally good. Steel rails are quoted from $12 to $14; cast iron borings from $6.50 to $7.50; steel axles from $18 to $20.

Buffalo.—A fair amount of business is being done and a large number of enquiries are out. Dealers' demands are, however, more than the consumers are willing to pay in many instances, especially in heavy melting steel. Dealers are holding for $16.50 to $17, and expect a $20 price before long.

New York.—Contrary to prevailing conditions in other countries, the most activity here is in heavy melting steel, borings and turnings and iron pipe. Prices have advanced on an average 75 cents during the past week. Chinese interests recently purchased 3,000 tons of steel scrap.

St. Louis.—Although various railroads offered last week an aggregate of 7,000 tons, the market continues to hold its strength. This is chiefly due to trading among the dealers themselves, which continues, though little business is being done between consumers and dealers. Prices are therefore nominal.

Cincinnati.—The feeling of the dealers is reflected in prices, which have been advanced on several grades. Rerolling steel rails have shown the greatest strength in this direction, being quoted $17 to $18 per gross ton dealers' yard. Other grades have gone up 50 cents to $1.50 per ton.

Cleveland.—Although dealers have large stocks, they are disposed to hold them for better prices. Heavy melting steel has sold as high as $18.50, one consumer taking 1,500 tons at that price. There has been a general advance in all other grades, No. 1 cast being quoted $23 to $24.

BUYING BETTER

Reports Indicate That Business is Now On a Much Better Footing

CONTINUED activity in the centres where the buying movement originated, and an improving interest in some of the quieter spots, are the market features this week. Following are reports from various centres:

Chicago.—Genuine enquiries, followed by prompt buying of round tonnages, describe the conditions here. Quantities closed run from 500 to 4,000 tons. Good enquiries for malleable are on the market. Stocks held on furnace banks are fast disappearing, and talk of blowing in idle stacks is heard.

Philadelphia.—Sales of foundry iron have been good during the week. Prices firm, though showing weakness in spots. While nothing that could be construed as a general buying movement has developed, a satisfactory increase has been shown in sales.

Birmingham.—The last two or three weeks have been responsible for business reaching nearly 150,000 tons. Yard stocks are showing signs of depletion, and the total holdings in this line are much below 100,000 tons. Export business is expected to improve with the easing off of freight rates.

Buffalo.—While the total quantity of iron sold does not equal that of the preceding week, a good business has been done. Most of it has been in foundry and malleable grades. One sale of 7,000 tons malleable is reported, the price being $27.75.

St. Louis.—Purchases are confined to small lots from carload to 200 tons, for immediate requirements. Furnace men are not pushing sales at the present prices, and consumers are not showing much anxiety to buy. The largest enquiry is for 2,000 tons from a stove concern.

New York.—Trading has not been so active during the past week, the aggregate of foundry iron having reached about 35,000 tons. While freight rates are declining, exporters are finding it difficult to get replies to their cables. Furnaces are not making any concessions for last half business.

Cincinnati.—Sales have not reached the standard of the past few weeks, though enquiry for last half foundry is good. Four thousand tons for August-September delivery are being sought by the Standard Sanitary Manufacturing Co. Schedule price is being maintained on high silicon grades, which are in good demand.

Cleveland.—Numerous sales of round tonnages, mostly for last half, have featured an active week's trading. Sales of 130,000 in the first two weeks of June are reported by two sellers. Some sales have been made for first quarter 1920. Steel-making grades are quiet.

45,000 SHOWERS

A Manufacturer Gives the Details of Filling a U. S. Government Order for 45,000 Shower Heads, Using Geometric Die Head and Collapsing Taps.

"On the main thread of the shank 3⅜"-16, we average 230 per hour, with a surface speed of about 400 feet per minute. On the pig iron end we averaged 220 per hour, with a surface speed of about 200 feet per minute. This speed may seem a little low, but we cut this down in order to get a quicker handling of the work. We handled these in air chuck, and in releasing air chuck the work automatically dropped to a box below.

"On the face, tapped 3⅜"-16, we averaged 210 per hour, with a surface speed of about 400 feet per minute.

"We were very much pleased with the Geometric tools on this work, especially with the chasers, as we completed 30,000 showers, male thread, with one set of these chasers."

Try a Geometric Thread-Cutting Die Head or Collapsing Tap on your work, and be equally pleased.

C.A.S.E. GATHERING AT BRANTFORD WAS A MOST SUCCESSFUL EVENT

THE busy manufacturing city of Brantford was the place chosen for the 30th annual convention of the Canadian Association of Stationary Engineers, which was held on the 24th, 25th, 26th June.

The local lodge, Brantford No. 4, which had the arrangements in hand, rose to the occasion, overcoming quite a number of severe handicaps in ensuring a successful meeting. Not the least of these obstacles was the influenza epidemic, which laid the members of the lodge by the heels one after the other. Just to show that they were superior even to influenza, the local committee commandeered the Emergency Hospital building to hold the convention and power exhibition in. Needless to say, the last remaining germ was driven forth before the convention assembled, and the building made a very suitable place for gathering the various mechanical exhibits.

The Exhibits

The number of firms exhibiting power plant accessories and appliances were as numerous as in former years, and the quality of the exhibits compared favorably with any previous exhibition. The opportunity for getting acquainted with the latest aids to economical power production was appreciated by some of the delegates, but on the whole the attention given was not all that might be desired.

The business of the C.A.S.E. delegates to the Grand Lodge was carried on in private sessions during the three days, the election of officers taking place on the morning of the last day. The place of meeting for the convention of 1920 was chosen at Woodstock, Ont.

The executive officers of the Grand Lodge, C.A.S.E., were elected as follows:

Past president—W. Cook, Belleville.
President—Geo. E. Moll, London.
1st vice-pres.—I. J. Tait, Montreal.
2nd vice-pres.—D. L. Webster, Brantford.
3rd vice-pres.—Fred Harper, Kingston.
Sec.-treasurer—John Hale, Hamilton.
Conductor—Ross C. Leach, Toronto.
Doorkeeper—Geo. Lee, Ottawa.

Mr. W. Cook was chosen as a delegate to the National Association of Stationary Engineers, with Mr. Balmfirth, Toronto, as alternative delegate.

The Exhibitors' Association also elected their officers for the coming year, the results being as follows:

President—Jas. Mock, Montreal.
1st vice-president—J. E. Fitzgerald, Montreal.
2nd vice-president—Grant Cole, Toronto.
Treasurer—L. L. Archibald, Toronto.
Secretary—Gordon C. Keith, Toronto.
Asst. Secretary—Geo. M. Wilkinson, Toronto.

Chairman Exhibits—A. Betton, Toronto.

Committee Exhibits—E. Hanson, Toronto; H. Fletcher, Toronto.

Entertainment Com.—Chairman, Bertram Curzon, Montreal; H. Burbridge, Montreal; H. W. Cockfield, Toronto.

Reception Com.—Chairman, R. Sexton, Toronto; J. Thompson, Earl Gordon, Hamilton.

The Entertainment Committee of the Exhibitors' Association provided a varied programme of amusements during the convention. The final event, under the auspices of the Brantford Lodge, was the annual ball. This was held in the Masonic Hall, and was very well attended, forming a fitting wind up to a successful and pleasant convention.

CANADIAN ELECTRICAL ASSOCIATION DISCUSSED WIDE VARIETY OF MATTERS

The annual convention of the Canadian Electrical Association was held on June 27 and 28 at Alexandria Bay, Thousand Islands, this location providing a delightful outing for the members in combination with the necessary business meetings. The programme consisted largely in the presentation of reports from committees much as former years. These reports were submitted from the committees on accident prevention, prime movers, electrical apparatus, meters, rate research and light and power sales.

Progress has been made in the field of prime movers during the last year. Larger turbo-generators have been installed, and while this has been the case, operating troubles have been experienced. These troubles have in some measure been caused by the necessity for employing inexperienced help owing to war conditions. More rigid inspection is being carried out. Higher steam pressures are much in evidence and the development of still higher pressures seems to be a matter of boiler design.

The water turbine has seen little development in the last year, but the use of high specific speed vertical single-stage runners is rapidly becoming standard for all low-head installations.

A very important feature, and one around which much discussion arose, had to do with the newly-appointed engineering standards committee at Ottawa. The electrical industry could be materially benefited by co-operation with this committee and by the adoption of standards tending towards elimination of useless features of design.

Power sales of various large companies are practically as good to-day as when the armistice was signed. The signing of the armistice rendered a decrease in power sold inevitable for a short time, but this was almost wholly regained before the close of 1918.

Industrial lighting has received a considerable impetus, and well-designed lighting installations have been a material factor in the production of munitions. Greater attention will necessarily have to be devoted to this subject by the industry in the future if production is to be maintained.

One of the most interesting features of the convention was the paper delivered by E. P. Fredericks on "Service at Cost Plan as Applied to Public Utilities." This plan in brief guarantees the return of a fair amount on capital to the investor, insures an economically-managed plant and protects the public from extortion. While new in some parts of the country, the scheme has been well tried in a dozen or more cities and has been found to be the only solution of the urban transit problem. Various methods have been adopted to ensure satisfactory operation but in practically all of them street railway fares fluctuate at six month or longer intervals, according to the state of a reserve fund.

CONTROLLING CANADIAN SHIPPING NOT TO INTERFERE WITH BUILDING

MR. BALLANTYNE has introduced an amendment to the Canada Shipping Act providing that a shipowner wishing transfer of registry or of mortgage, must apply to the Minister of Marine to get it. In doing this Canada is following the precedent of Great Britain, the action being taken in order that there may be assurance none of our shipping will get into foreign hands. Under the provisions of the bill a foreign company applying for the registry or transfer of a ship must come to Ottawa and apply to the Minister, so that the bona-fides of the applicant and all particulars may be investigated. The bill is to remain in force for three years after the signing of peace.

Objection to the bill was made by Mr. Duff, of Lunenburg, an old opponent of the Minister's, who conducted a spirited attack on the Naval Department this session. He claimed that it would put many wooden shipyards out of business. Most of the wooden ships built in Canada are for sale, and not intended for the Canadian trade. He said it would work a hardship on shipowners. A ship might be in Brazil or France and a sale made by telegraph through the captain, which would require immediate acceptance. Application to Ottawa as required by this bill would, in Mr. Duff's opinion, create such delay as to make sale impossible or difficult.

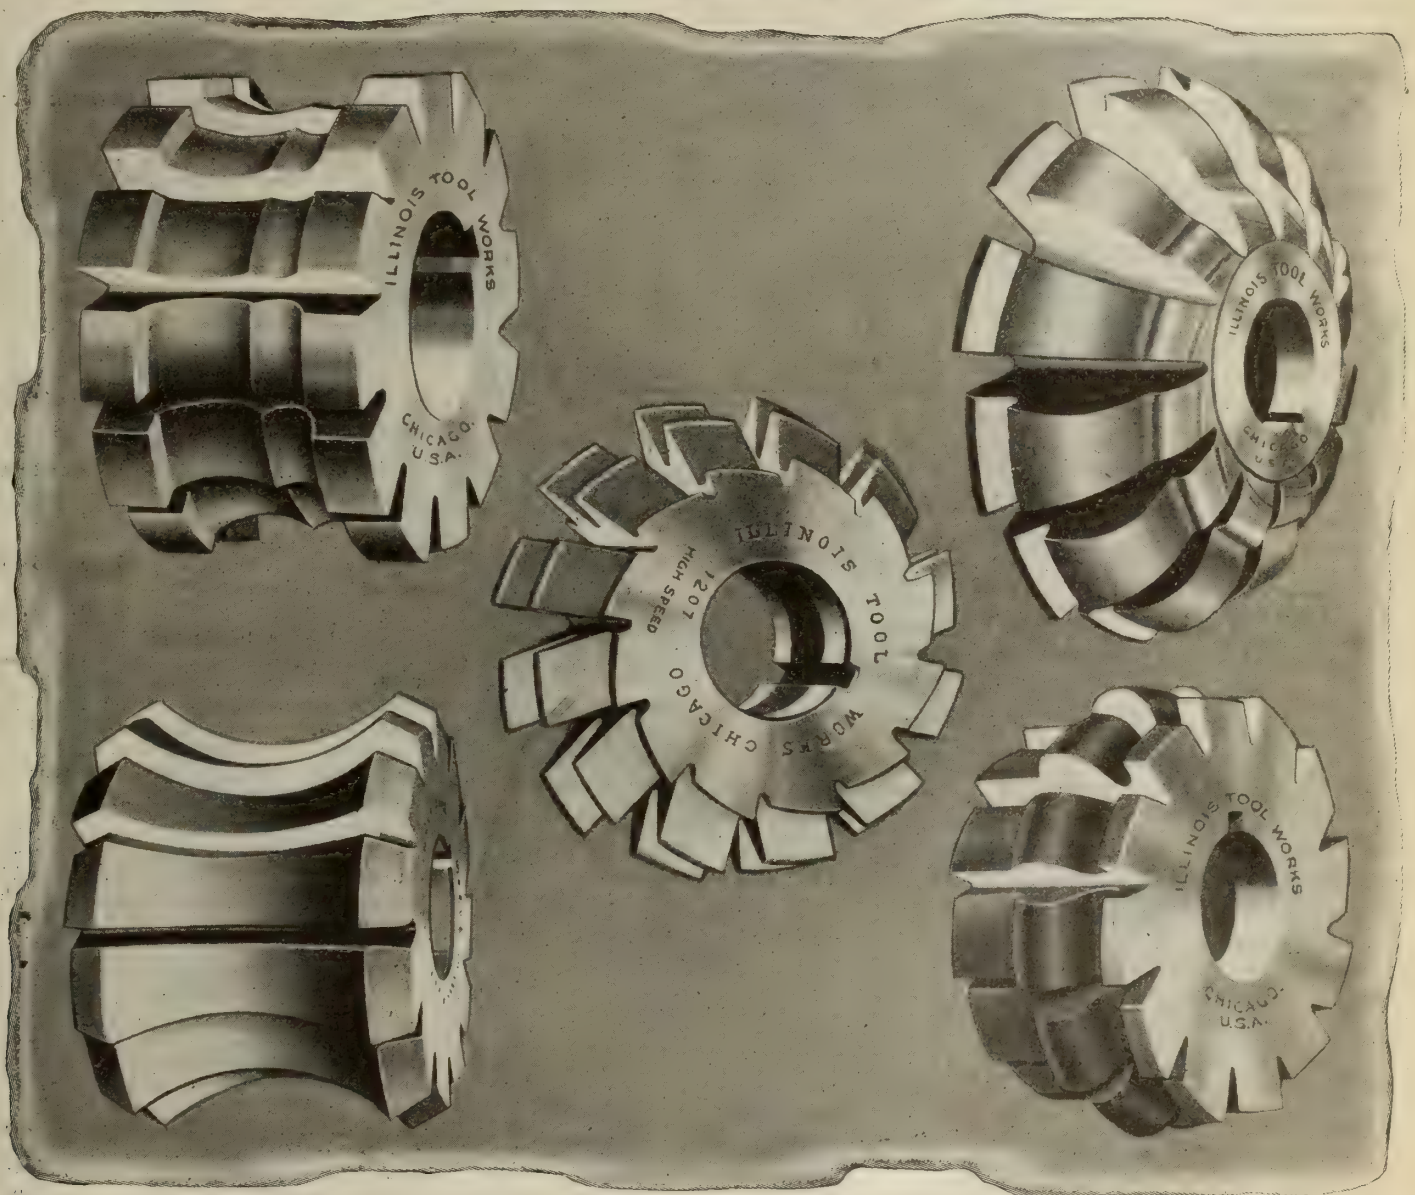
ILLINOIS
TOOLS



"ILLINOIS" Formed Cutters are noted for their accuracy, dependability and durability. Our engineer-experts insure those qualities, from the selection of the high speed steel to the final testing of the finished tool, no matter how unusual the requirements or design. That's why "Illinois" stands for infallibility in tools.

Why Dominion Friction Surface Belting Keeps Employees Satisfied

There are few manufacturers who haven't discovered that satisfied employees are an absolute necessity to low cost of production.

But poor equipment will not keep employees contented — it will not permit maximum production — it increases upkeep cost — it creates needless waste of time for operators and machines while making repairs.

Dominion Friction Surface Belting, in eliminating these conditions, does much to keep employees satisfied, for it enables operators to turn out maximum production at low cost — does away with most transmission troubles and saves power by taking a grip on pulleys that practically prevents all slipping.

Our Belting Experts are ready to show you how this "plus service" belting will keep your employees satisfied, just as they have for many other manufacturers. Phone, wire or write to our nearest service branch—there is no obligation.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

TRADE GOSSIP

New Pulp Mill.—Five million dollars are to be spent by the Spruce Rock Falls Pulp and Paper Company, who will start on July 15th on the erection of a large mill and townsite, near Kingston, Ont.

C.P.R. Buys Land.—An additional eighteen acres has been acquired by the Canadian Pacific Railway at Swift Current, Sask. The property is located south of their tracks and west of the North and South highway. What use is to be made of it is not divulged.

Dominion Foundry to Close.—The Dominion Foundry plant at Hamilton will be closed down for two weeks in July while electric ovens are installed. Not many men will be affected, as the plant has been running light for some months. It is reported that the company intends to operate rolling mills in the course of a couple of months.

New Flour Mill.—Mr. R. M. Pincombe of Strathroy has purchased the property belonging to the estate of the late John Mills, adjoining the G.T.R., and will erect a flour mill having a capacity of 250 barrels per day. The mill will be operated by hydro power, and be thoroughly up-to-date in its equipment. The grain elevator will be moved from its present position to a site adjoining the new mill.

New Brunswick Telephone Construction.—An expenditure of between $150,000 and $200,000 will be made this year by the New Brunswick Telephone Company, according to officials who are on a tour through the St. John Valley. New copper circuits from Bathurst to Dalhousie and St. John to Moncton are included in the estimates, which will improve the service and allow for extensions to existing lines.

Bertram's Annual Pic-nic.—The annual pic-nic of the employees of the Bertram and Pratt and Whitney's, one hundred and fifty strong, motored out from Hamilton to Grimsby, where a programme of sports and races was gone through. A baseball match between representatives of the two firms was won by the P. & W. team, who received a beautiful silver cup as the result of their endeavors. Refreshments were served, and the day was voted a great success.

C.N.R. Construction.—The only thing delaying construction on the Kamloops-Kelowna branch of the C.N. Railway is the unsettled state of the labor market. Contractors and sub-contractors are now in their appointed localities, and will start work just as soon as they can secure the necessary help. Major Swan, the divisional engineer, states that every effort will be made to complete the whole section by the fall of 1920, but in any case the Lumbly spur will be made available for marketing fruit this fall.

Who is the Owner?—The New Glasgow "Chronicle" wants to know who is the real owner of the cars now being built by the Eastern Car Co. for the Canadian Government and labelled Canadian National. It points out that on a recent shipment of cars the legend "Canadian Northern Railway" appears. On the flat cars now being built is the name of "General Trust Co., Trustee, Owner and Lessor, Philadelphia, Penn." On the gondola cars still another title appears, "Property of Canadian Northern Rolling Stock Co., Ltd."

Erect Fuel Factory.—The Anthracite Briquette Company will start building immediately on the new industrial site of the Toronto Harbor Commission a factory for the making of compressed anthracite briquettes. Large supplies of waste anthracite have been secured, and the plant will have at first a capacity of ten tons per hour. The rights of a patented binder have been secured from the United States. The use of these briquettes will, it is claimed, make a big saving in the cost of fuel. Some of the best brains of the chemical staff of the Toronto University have been connected with the process, and it is understood to be a first rate commercial proposition. The capital is all privately subscribed.

Ontario's Production.—In the annual report to the British Parliament, F. W. Field, the British Trade Commissioner, gives some interesting figures. Ontario gives 46 per cent. of the mineral production of Canada, and 30 per cent. of the wool clip. One-half of the manufactured goods are made in Ontario, and one-third of the agricultural product is grown here. Ontario yards received 30 per cent. of the shipbuilding orders.

To Build New Hospital.—Toronto intends to build a new reception hospital, and Controller Cameron presented a motion that the city architect be instructed to prepare the necessary plans and estimates. An extension to the Civic Abattoir is also contemplated, at an estimated cost of $50,000.

May Arbitrate Now.—Mr. F. G. Wallace, president of the Canadian Locomotive Company, Kingston, has replied to the letter sent him by the committee appointed by the City Council to endeavor to bring about a settlement between the company and its striking employees. Mr. Wallace, in thanking the committee for its kind offer, says that the time is not opportune for outside intervention, and continues as follows: "Had we refused to meet our employees, your committee might have been of great assistance, but our men fully understand that they can arrange a meeting with us at any time they so desire. Under these circumstances you will readily see that it is impossible for us to avail ourselves of your kind offer." The Strikers' Committee has written the Council's Committee that it is ready to negotiate its differences.

MUNICIPAL

Pembroke is going to have a new lighting system.

A memorial club house, costing $35,000, will be built at Brampton.

Work is being commenced at once on extensions to the rail mill at the Algoma Steel Corporation.

Sarnia is going to vote on July 4 on by-law for new collegiate and technical school to cost $350,000.

The Township of York call for tenders for the construction of a number of cast iron water mains. Frank Barber, 40 Jarvis St., Toronto, is the engineer.

Niagara Falls, Ont., contemplate making improvements to the electric light plant and system. Debentures for some $18,000 will be issued to provide for the work.

The Town of Aurora, through James, Loudon & Hertzberg, 36 Toronto St., Toronto, are in the market at once for a centrifugal pump of 750 gallons per minute capacity, to be driven by a gasoline engine.

PERSONALS

Alex. Lentz, for the past five years secretary and manager of sales of Brown's Copper and Brass Rolling Mills, Limited, Toronto, has resigned that position, effective July 1st, and will be associated with the Kent, Ockley, Limited, Toronto, as vice-president secretary and treasurer.

MARINE

Collingwood.—The Collingwood Shipbuilding Company launched the "Canadian Signaller" from their Collingwood yard, making the fourth ocean-going steamer to leave their ways this year.

Detroit.—The steamer J. T. Hutchinson loaded with ore has gone ashore on Trout Island shoal, and is leaking badly. A wrecking steamer from Sault Ste. Marie has gone to her assistance. The steamer Major is also reported to be off the port of Lexington, and a steamer from Port Huron has gone down to help her off. She went ashore in a thick fog.

Victoria. — The Foundation Company had a successful launching of their eighth ship recently when the Ottawa was put in the water. This is the eighth ship out of the twenty building for the French Government. The launch was in charge of the assistant Northwest manager of the Foundation Company, Mr. Edward E. Jenkins. The sponsor was Mrs. W. J. Stephens.

Washington.—The American Bureau of Shipping, which has been formed in the U. S. on somewhat similar lines to those of Lloyd's Register in Great Britain, is expected to do great things for American shipping. Commodore E. P. Beethold, commandant of the Coast Guard, will take charge of the Bureau, and is retiring from his present position on June 30th for this purpose.

Victoria.—The first of the twenty ships building by the Foundation Company for the French Government made her steam trials recently. The course used by the Imperial Munitions Board was the one chosen. The vessel on trial was Hull 207. Hull 216 will be ready to take her trials early in July, and there are several other hulls waiting their turn at the fitting-out shed.

Victoria.—The Canadian Merchant Service Guild has been incorporated at Victoria, and will be incorporated with the other branches of the guild, making it one big organization. The headquarters of the Western body will be at Victoria, the Middle East at Collingwood, and the Eastern at Halifax. There are already 500 members in the Western body, which embraces the entire coast and lakes of British Columbia.

Victoria.—An unusual scene was witnessed recently when the Prince Rupert was being loaded for her trip to the North. The officials of the Grand Trunk Railway, from C. E. Jenney, the general agent of the company at Vancouver, turned to and assisted in getting the freight and baggage aboard the vessel. The vessel was bound for Vancouver and Prince Rupert, and carried a large number of passengers, as well as supplies for the Northern ports.

London, Eng.—In reply to a question in the House of Commons, Mr. Bridgeman, Parliamentary Secretary to the Board of Trade, said that the resolution of the Imperial Conference with reference to steamship lines did not aim at creating either lines or subsidies. It simply urged that the best mail service possible should be given, between Canada, Newfoundland, and Australia. An Imperial Investigation Board was being created, which would deal with these questions.

Ottawa.—Although the war is over, the amount of shipping passing through Canadian ports under the control of the Canadian Director-General of the British Ministry of Shipping is larger for the first five months of 1919 than it was in the demobilization period of 1918. The total tonnage for the five months is 1,804,995 tons, nearly as much as the total tonnage for the year of 1916. The total amount of material and supplies, exclusive of horses and mules, cleared from Canadian ports since August, 1914, to May, 1919, is 14,044,758 tons.

Montreal warehouses are filled to capacity with freight waiting for shipment. This is due to the shortness of tonnage, and there is no prospect of immediate relief. The British Ministry of Shipping still controls 70 per cent. of the available cargo space, and it is a strenuous job for the steamship companies to divide out the remaining 30 per cent. without hurting the feelings of at least some of their clients. Col. W. I. Gear, of the Robert Reford Co., states that the Cunard line has chartered and purchased every available ship, while the Donaldson and Cairn lines each expect a new ship about August.

Vancouver.—Addressing the retail bureau of the Board of Trade at a luncheon, Commissioner McClay stated that the construction of harbor facilities would be started as soon as the Government allocated the $5,000,000 appropriation to the work. These facilities consisted of a terminal railway, four new deep sea berths with fire-proof sheds, a lumber assemblage wharf for export lumber, a large central booming ground for saw logs, oil storage tanks for non-inflammable oils, and the purchase of a suitable fire and tug boat combined. The speaker in calling attention to the importance of shipping to the port, mentioned that a ship of the Robert Dollar Line spent as much as $40,000 in the port each trip.

TENDERS

Board of Trustees, Pathfinder School District No. 3690, Manville, will receive tenders up to July 12th for the erection of a frame school building. Plans and specifications from the office of the Secretary-treasurer, Manville.

The town clerk of Oakville will receive tenders up till July 7th for the supply of material and construction of tarvia or asphalt macadam pavement on six streets. Plans and specifications at office of town clerk, Oakville, or Jas. A. Bell and Son, St. Thomas, Ont.

The City of Toronto require tenders, by registered post only, up to July 8th,

for asphalt, bitulithic brick block and track allowance pavements; also concrete sidewalks. Specifications and forms can be obtained at the Dept. of Works, City Hall. Tenders to be addressed to Chairman Board of Control.

The Department of Railways and Canals ask for "Tender for Tugs," tenders to be in by July 7th for two tugs from 250 to 400 h.p. each. Not less than 75 feet or more than 100 feet in length, 18 to 22 feet beam, and nine to 10½ feet draught. To have compound or triple expansion condensing engines, and to carry not less than 125 lbs. steam pressure. Accepted cheque for $1,000 to accompany each tender. Complete specifications, boiler inspection report, and place where tug can be inspected to accompany tender.

CATALOGUES

The Bastian-Blessing Company, Chicago, have issued a pamphlet entitled A New Principle in Welding and Cutting Apparatus. This publication takes up the principles on which their torches operate and also gives the advantages resulting from this apparatus.

The Foster Instrument Co., Letchworth, Herts, England, have issued a very practical chart on the care and use of pyrometers. This chart, suitable for hanging up in the works, contains hints on the use of pyrometers of various types, such as radiation thermo-couple and electric resistance, and also has a useful Fahrenheit-Centigrade conversion chart ranging from 50° to 3550° Fah.

CONTROLLING CANADIAN SHIPPING

Continued from page 72

The Minister allayed his fears somewhat by saying that there would be no delay. The incident opened up a very interesting discussion on shipping, in the course of which some very interesting information was elicited. Mr. Duff said that there was a lot of American money which might be put in Canadian shipping if encouraged. He himself knew of one Boston man willing to invest fifty thousand dollars in Nova Scotia ships.

Mr. Ballantyne assured Mr. Duff and other critics that there would be no interference or delay, as it was the policy of the Government to increase all Canadian shipbuilding. But a certain amount of caution had been shown to be necessary. One of the neutral countries had applied to Canada for registry for a ship which it was found was to engage in enemy trade. The principal object of the bill was to see that none of our ships get into the hands of enemies, and to conserve Canadian tonnage for Canada as much as possible.

Michael Clark objected to the principle that we should try and prevent the enemy countries getting shipping facilities; without them they could never export the goods to pay the indemnities, but the Minister insisted that if he received an application from Germany or

Austria, he would refuse it. During the course of his speech he remarked that a large number of wooden ships had recently been transferred from Canadian to Newfoundland registry, which involved a stay of the man concerned only three hours in Ottawa. He assured Mr. Duff that there would be no trouble in any case.

During the debate on the budget the member for South Cape Breton, where the coal and steel works are located, brought up the matter of Canadian shipping commandeered by the British Government during the war, and not yet returned, though badly needed. The Nova Scotia and Dominion companies have lost control of the St. Lawrence coal trade, which has passed to American interests, through lack of shipping. The ships taken were under long contract. The matter has since been brought up in the House and the Premier made a statement, in which he left the impression that the Government was doing everything possible to get the ships out of the hands of Great Britain, but it was hanging on to them like grim death. Mr. Ballantyne and others stated pretty frankly their opinion of the spirit which insisted on retaining the ships to the profit of those who have them, but to the loss of Canada.—T.M.F.

GREAT LAKES TRANSPORTATION COMPANY

Mr. John Bell, who is in charge of this firm's business at Fort William, seems to have been causing a great deal of activity around the river since he took over the ice-breaking contract last fall. We understand he will have three tugs in commission during the summer months and a very fine steel tug is being built in Midland specially designed to keep the harbors at Fort William or Port Arthur open as late, or early, as may be found necessary.

Mr. Bell is getting together a very fine salvage outfit, and while not employed in that special work it will be kept busy towing sand and gravel from the North Shore of Lake Superior.

CONCRETE CHIMNEYS AND LIGHTNING

A concrete chimney, 6 ft. by 120 ft., was struck by lightning recently, and though without lightning rods it was not injured in the least. The chimney stands in the midst of greenhouses, and if it had been brick, there would undoubtedly have been some lost glass.

Commissioner Chisholm's Remedy.—Riverdale and other parts of Toronto have been suffering considerably from the effects of the soot deposited by the smoke from the many locomotives working in the vicinity. A test case is being brought against the C.P.R., to see if the city by-law cannot be enforced against the company for operating locomotives that give forth more smoke than the law allows. Commissioner Chisholm suggests the electrification of all railroads coming into the city as the only remedy.

Power Press Bargains

Partial Selection from our Big Stock:

3—Used FERRACUTE D-201 Vertical Double-geared Straight-sided Single-action Redrawing Presses, having capacity for exerting pressure of 200 tons. Length of stroke, 10". Distance between columns, 32".

1—Used FERRACUTE D-151 Vertical Double-geared Straight-sided Single-action Redrawing Press, exerting 150 tons pressure. Length of stroke, 13". Width between columns, 32".

6—Used FERRACUTE DGG-56 Vertical Double-Geared Straight-sided Single-action Redrawing Presses; 5 of these presses have 18" length of stroke and 1 has 20" length of stroke. Distance between uprights, 30".

7—Used FERRACUTE DGG-56 Vertical Double-Geared Straight-sided Single-action Redrawing Presses, exerting 100 tons pressure; 6 of these presses have 15" length of stroke and 1 has 12" length of stroke. Distance between housing, 30".

6—Used FERRACUTE DGG-55 Vertical Double-geared Straight-sided Single-action Redrawing Presses, exerting 75 tons pressure. Three of these presses have 15" length of stroke and three have 18" length of stroke. Distance between housing, 26".

1—Used FERRACUTE C-5 Open-back Inclinable Cutting Press, Direct Belt Drive., that is, not geared, having capacity for exerting about 50 tons pressure. Length of stroke 2". Distance from centre of ram back to frame, 12". Width of opening through back, 18½". Height of opening through back 7½".

3—Used FERRACUTE PAG-4 Geared Adjustable Bed Punching Presses, having capacity for exerting 50 tons pressure. Length of stroke, 2". Distance from centre of ram back to frame, 8½".

3—Used FERRACUTE PA-3 Adjustable-bed Punch Presses, not geared, having capacity for exerting about 35 tons pressure. Length of stroke, 2". Distance from centre of ram back to frame, 7".

1—Used BROWN-BOGGS No. 215 Inclinable Power Press. This is a geared press. Arranged with 24" x 6" pulley. Distance back from centre of slide, 9½". Distance from bed to slide, when up, 13¾". Width between gibs, 11⅞". Length of stroke, 4".

7—Used FERRACUTE D-45 Horizontal Double-end-Screw Press designed for deepening or redrawing sheet metal tubes and shells about 3" diameter and 18" deep. Capacity for exerting 100 tons pressure. Three of these presses have length of stroke of 36" and 4 have length of stroke of 40". Diameter of ram screw, 6½". Diameter of side rods, 5".

2—Used E. W. BLISS No. 60½ Vertical Geared Rack-driven Presses. Length of stroke, 36".

3—Used FERRACUTE E-57 Vertical Geared Toggle Coining Presses. Length of stroke, 3".

5—FERRACUTE E-56, Vertical Geared Toggle Coining Presses. Two of these machines have 3" length of stroke and 3 of them have 2" length of stroke.

4—Used No. 666 Vertical Geared Toggle Presses, manufactured by the TOLEDO MACHINE & TOOL COMPANY. Having 2¼" length of stroke and capacity for exerting 1,000 tons pressure on ram.

NOTE:—The above presses were all operating on manufacture of Cartridge Cases when work stopped about nine months ago. They were purchased new from manufacturers from February, 1915, to September, 1915, and have had about two years' service. They were not used continually since being purchased. Some have been repaired and all have been kept in good running order—Examination can be made in Montreal.

TERMS:—25% with order balance against Bill of Lading.

NOTE:—If these presses were to be shipped back to the United States there would be no duty to be paid—You would only require to add freight from Montreal to destination (except Brown-Boggs Press).

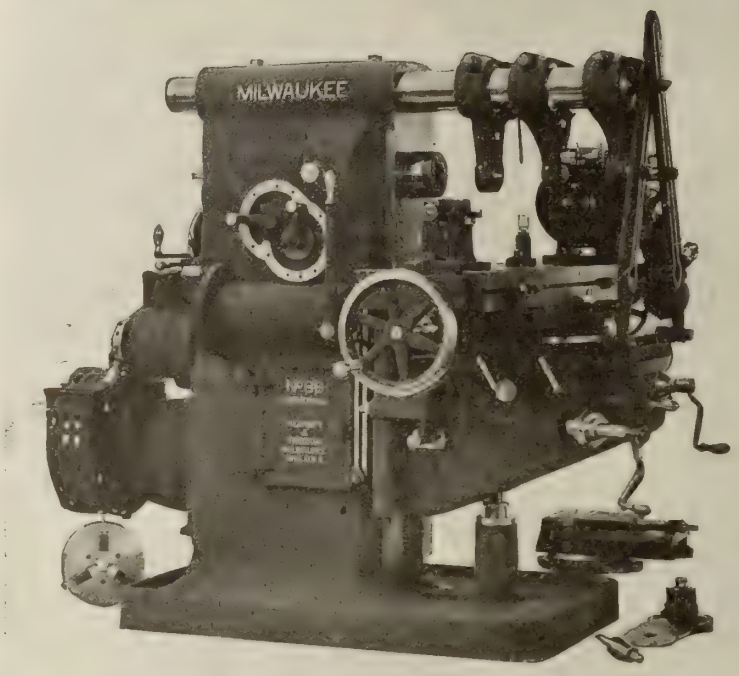
MILWAUKEE MILLING MACHINES



Rigidity, Strength, Accuracy

Extreme rigidity, strength and accuracy are fundamental—vitally necessary in a good milling machine.

You'll find them ever present in the Milwaukee.

The Column is a one-piece box section casting with few and small openings. The base is made pan shape to catch splashing oil and chips. The dovetail of the knee slide is extended upward to the overarm for the effective affixing of attachments.

The knee is also a box section casting without holes or slots through the top to close under pressure and impair the alignment of the work. The bearing of the knee on the column is extended well above the saddle slide.

The double overarm provides for positive alignment of the arbor and prevents it from being pounded out of line when using large, coarse pitch cutters on rough, heavy work. Cutters can also be used at a greater distance from the face of the column.

The spindle has a large flange forged on the end. This flange carries keys for driving large face milling cutters that are attached directly to the flanged end by means of four bolts and also for driving the hardened steel arbor drive collar. The arbor drive collar protects the end of the spindle from injury, so that when face milling cutters are attached they run true. The reverse for the spindle is self-contained within the machine, no overhead apparatus being necessary.

All gears and bearings in the column and feed box are automatically flooded with lubricant that is pumped to the top of the machine and distributed by a perforated pipe, flooding downward and thoroughly lubricating the gears and bearings.

Every Milwaukee Milling Machine is equipped with a cutter lubricating system which is an integral part of the machine. This equipment was considered in the original design and is not added as a separate item. The cutter lubricating system operates only when the spindle is running.

Complete facts regarding Milwaukee Milling Machine will be found in our catalogue, which will be sent on request.

KEARNEY & TRECKER CO., Milwaukee, Wis., U.S.A.

Don't Read This Ad—

If You Want To Throw Away Money

on transmission troubles. As you well know, there's no easier way to spend money than on power losses, hot boxes, lubrication, etc. Thousands are spent yearly in fighting these evils. But, if you are reading this ad, you are tired of paying for these troubles. Good! Here's the panacea: **Chapman Type Ball Bearings** are durable almost to the point of permanency; save an average of 20 per cent. on power; eliminate 75 per cent. of your friction losses, and 95 per cent. of lubrication and attention. All your power is delivered to your machines. And they fit the frame you now have in your shop.

You have read this ad. Then find out about Chapman Bearings for your shafting hangers, pillow blocks, loose pulleys, friction clutches or wherever you employ bearings.

FORD TRIBLOC

The eighty-two pound pull of one man will lift a ton, for eighty per cent of the power applied to the hand chain of a Tribloc is converted into lifting energy—this high efficiency which lasts throughout the life of the hoist is due to the planetary gear operating mechanism with steel gears. Chains, hooks and all working parts, also are made of steel—a durable, dependable hoist construction.

The Loop Hand Chain Guide, a distinctive patented feature, makes a Tribloc safe in all operations and saves the working parts from damage and, when working at high speed, prevents "gagging" of the hand chain and its overriding the flange of the hand wheel.

There's a 5-year guarantee with every Tribloc—in capacities of ½ to 40 tons.

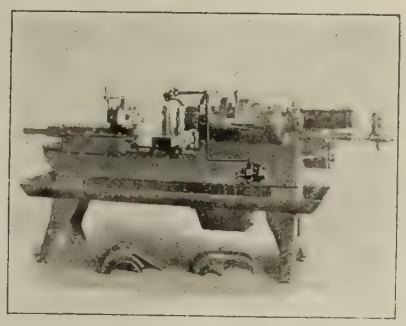
TRAHERN LUBRICATING PUMPS



Screw Machine
W. K. Millholland Machine Co.

It does not take much reasoning to reach the conclusion that W. K. Millholland Machine Company would be very careful when selecting a pump to install on their product before its sale.

They would choose a pump which they had tried and knew to be dependable.

They would select the best type from the dozens which are being manufactured to-day.

They chose a TRAHERN, for they knew it would increase the efficiency of their machines.

A trial is all that is necessary to convince you that they are THE logical installation.

We'll stand by you--Try One

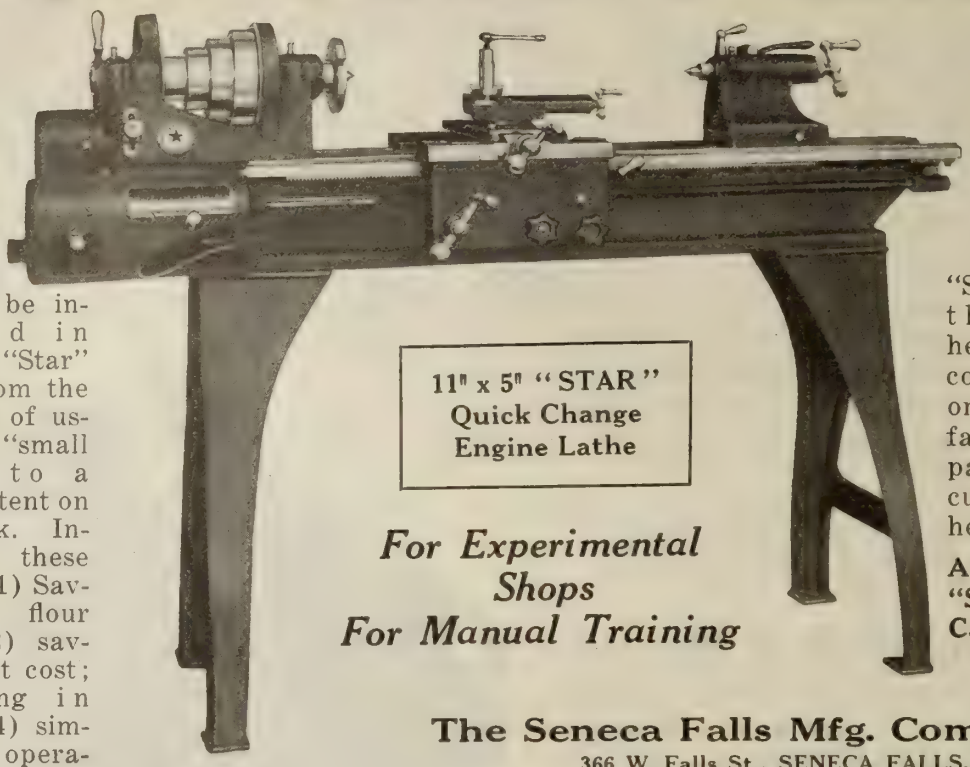
For Light, Accurate, Commercial Work



11" x 5" "STAR" Quick Change Engine Lathe

For Experimental Shops For Manual Training

You will be interested in studying "Star" Lathes from the viewpoint of using the "small lathe" to a greater extent on your work. Investigate these factors: (1) Saving in flour space; (2) saving in first cost; (3) saving in power; (4) simplicity of operation.

"Star" Lathes do the work of heavier, more costly equipment on light manufacturing and repair work. Accuracy is an inherent quality.

Ask for the "Star" Lathe Catalogue.

"OLIVER" Universal Saw Bench

A Pattern Shop Machine that you can keep busy all the time

Are you considering the Oliver Universal Saw Bench in connection with your "reconstruction" plans, or are you planning to buy *several* machines, each built for *one* purpose and used for only part of the time?

Reporting on this particular Oliver Universal Saw Bench our representative says: "A veritable procession of men used it all the time. One man had a cross-sawing job; a few turns of the handwheel displaced the rip-saw, which had just been used, and he was all fixed. Operations calling, in turn, for rip-sawing, cross-sawing, joint-cutting at various angles; or the use of the angular-attachment and tilted table in combination, rapidly followed."

This machine is a complete shop in itself

Have The Maritimes Had Fair Play?

THE Maritime Provinces did not enter Confederation very willingly and it may surprise people in other parts of the Dominion to learn that at the present time the people of New Brunswick and Nova Scotia are not altogether pleased with the results of the bargain. There is a distinct feeling among them that the advantages of Confederation have gone to the other Provinces. In the course of an article in the July issue of MACLEAN'S MAGAZINE, Thomas M. Fraser explains why this feeling has grown and the basis for it.

This article was written for the purpose of letting the other provinces know that the feeling exists but it will be of intense interest to people in the Maritimes. Be sure to read it—"The Spirit of the Maritimes."

"The Land of National Leaders"

An article on the political aspect of the Eastern Provinces and the achievements of their leading statesmen.

"Guarding Our Coast Line"

An extremely interesting description of the measures that were taken to patrol and guard the Atlantic seaboard during the war.

Bonar Law, the man from the Maritimes, who has been the able lieutenant of Lloyd George at all crises in Great Britain, appears on the cover in a handsome three-color reproduction.

Other Big Features of the Number

"With the Snowball Brigade"

By Captain Louis Keene

Just back from Siberia—Captain Keene tells some sensational and intensely gripping things about conditions in that country which the Canadian forces are helping to stabilize. It is a record of international complications, strange atrocities and almost unbelievable living conditions.

"The Three Tommies"

By Robert W. Service

A war poem of unusual strength.

"Solving the Problem of the Arctic"

By Vilhjalmur Stefansson

The fourth instalment of his remarkable story of the five years he spent in the north for the Canadian Government, appearing exclusively in MACLEAN'S.

Three Magnificent Stories

The best fiction obtainable is found in this issue: "Owners Up," a race horse story by W. A. Fraser; "His Majesty's Well Beloved," by Baroness Orczy; "Bunkered," by Allen C. Shore.

The Review of Reviews

Here are a few of the articles in this splendid department chosen as the best published during the past month in all magazines:

Finding Husbands For Three Million Women.
Will England Become an Agricultural Country?
Germany Can be Prosperous Under the Peace Terms.
The Woman Who Wrecked the World.
The Great Lama Rides in Motor Car.
Strange Personalities at Paris.
Making All Men Equal.
Winning the Secrets of the Desert.

War Record Not Made Public

The "Whitney" Special Quality "Type M" Chains

made a great showing during the war years 1916-17 and 1918.

Our tests and demonstrations were made on prominent 8-cylinder motors in service on a large number of cars in the State of Connecticut.

During this long period not a single "Whitney" Chain or Sprocket had to be replaced and the condition of every Drive has been pronounced remarkable.

One Drive recently examined had given over 35,000 miles' service and both Chains and Sprockets were in such perfect condition that they appeared good for more than double that record (Sprockets having no adjustment).

The links of this SPECIAL CHAIN have finished faces and reamed holes, and the smooth faces do not damage the Sprocket teeth.

Our war contracts were such that we did not announce this SPECIAL CHAIN until after the conflict was over.

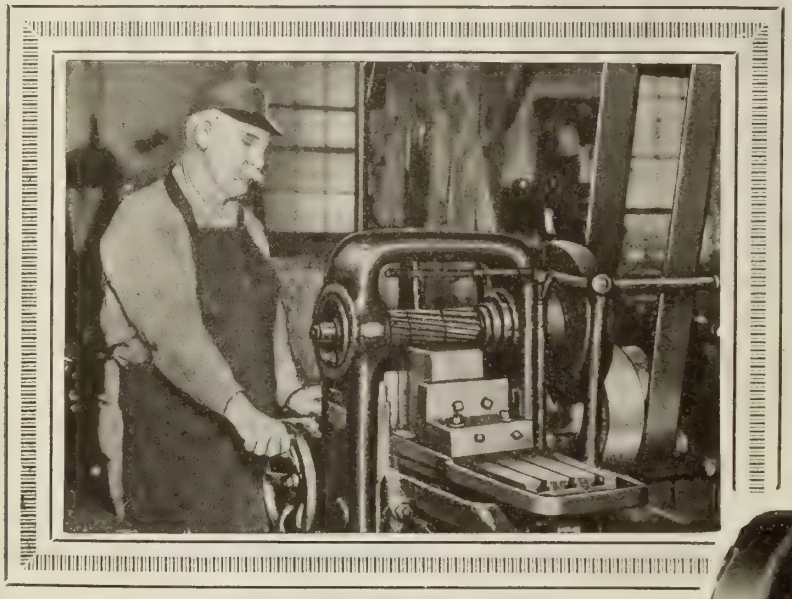
BRIGGS MILLER

Keeps Five Die Sinkers Going



HERE you see the Briggs Miller Squaring Die Blocks, and it is working so fast it keeps five die sinkers going.

Some are new, squared from the rough; some are old, annealed, cut down and made over; some are oblong, some square, in sizes up to 9 inches. This Briggs Miller has been squaring blocks for four years; has never given any trouble. When cutters get dull the operator has another gang ready to go on with the work. Unusual rigidity accounts for Briggs' higher efficiency.

Don't you think you could use this tool to advantage in your shop? Write for the details.

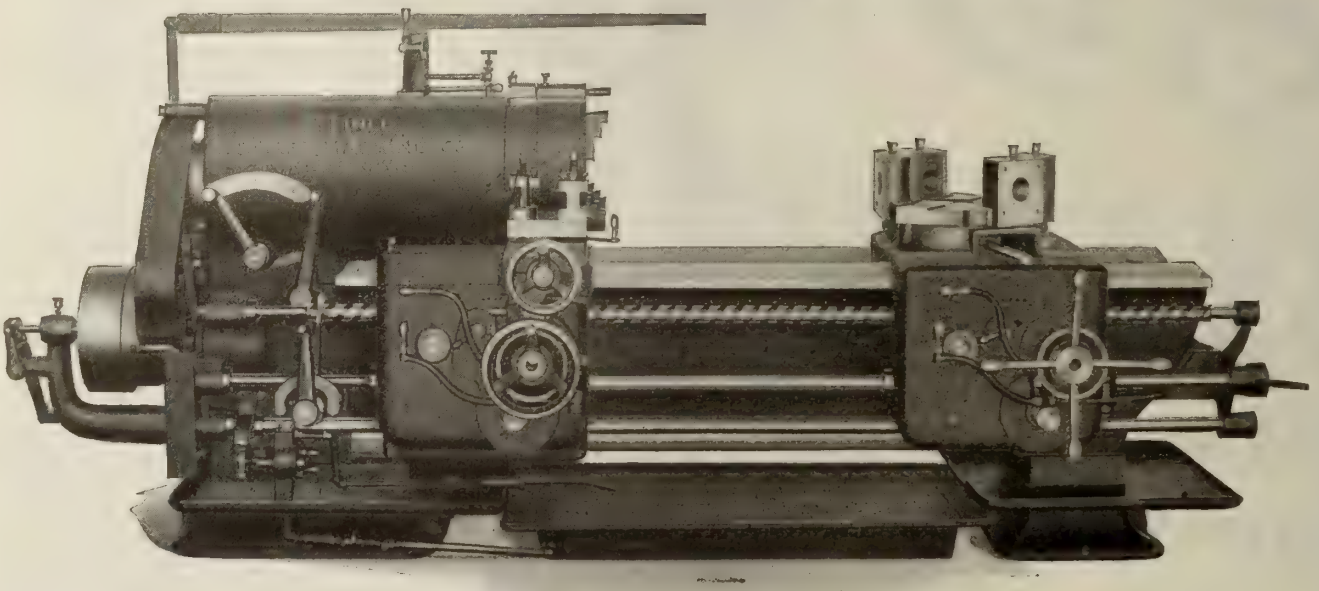
STEINLE



Another reason why the Steinle 24" Full Swing Side Carriage Turret Lathe is ahead of all others in the economical and accurate production of many classes of work.

The Massive High Powered
Quick Change Speed Headstock

The headstock housing is cast integral with the bed, this design insuring rigidity and permanence of alignment. This headstock is of box section entirely closed on front, top and bottom and also on the back with the exception of an opening left for assembling purposes and for which a suitable cover is provided. This design and the distribution of metal are arranged with a view of securing rigidity and also with the idea of absorbing all vibration due to heavy wide faced cuts and shock or jar incidental to intermittent or uneven cuts, all of which it successfully accomplishes. The thirty spindle speeds are substantially divided into three groups as follows:

First train of gearing: 10 spindle speeds corresponding to open belt speeds.

Second train of gearing: 10 spindle speeds corresponding to back gear speeds.

Third train of gearing: 10 spindle speeds corresponding to face gear or triple gear ratio. In reality the first train is back geared; the second double back geared; and the third quadruple geared. All of these gear ratios are high, resulting in great leverage in the application of power to the spindle. The utmost of power consumed in transmission is small, almost negligible in fact, with the result that the machine can be operated at very low power cost, the same amount of power being delivered to the spindle at all speeds but varying in the amount of torque according to the different gear ratios, the amount of torque increasing with the corresponding decrease in spindle speed.

All gear ratios and speed changes are controlled by conveniently located levers.

There are more good reasons why the Steinle 24" Full Swing Side Carriage Turret Lathe is ahead of all others in the economical and accurate production of many classes of work. We will give these reasons in future advertisements in this journal. Watch for them. They will be interesting to you.

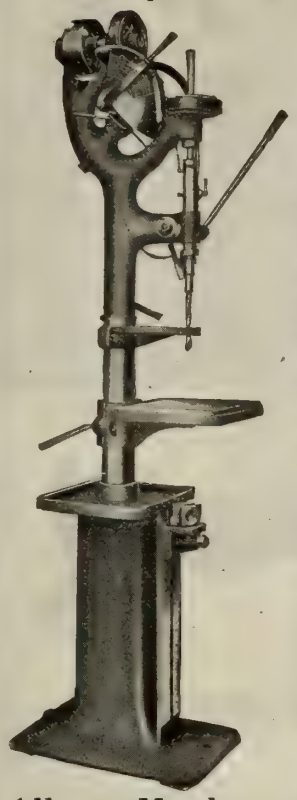
Albany 12" Tool Room Drill



A real time saver in drilling holes up to ½ inch, because—

Patented friction drive furnishes 10 spindle speeds, from 268 to 2140 r.p.m., which are instantly available.

The operator can drill at full speed to the finish, saving time on every hole. Micrometer gauge shows exact depth of drill at all times, and the spindle may be stopped — or started—almost instantly.

The average operator can use this drill with the facility and accuracy of an expert.

Splendidly built; has special ball bearing transmission; chucks and drills quickly changed.

Details in Circular.

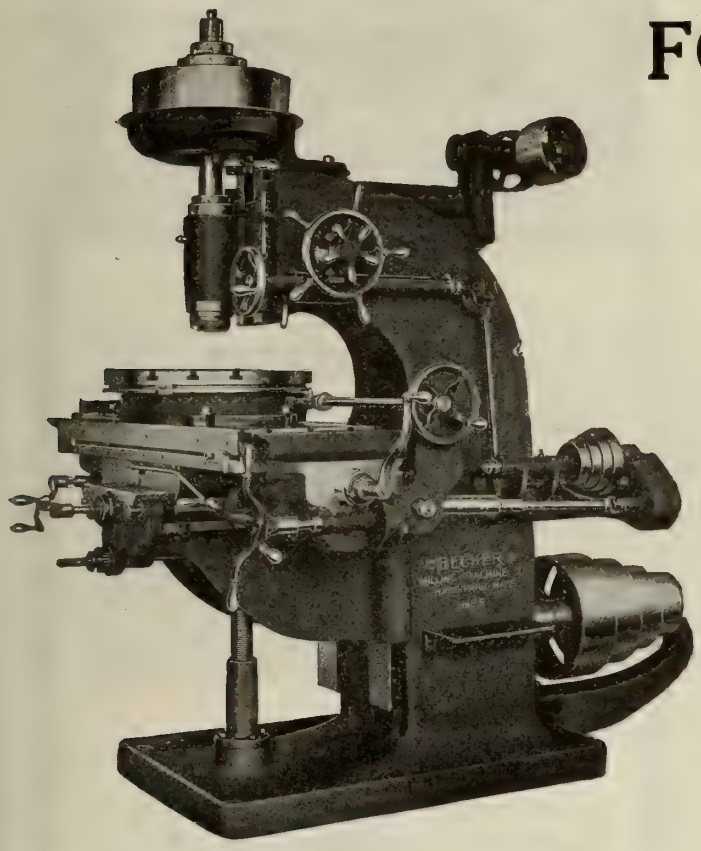
BECKER Belt Driven MILLERS

FOR PRODUCTION



"THE MACHINE
THAT GIVES THE
SMOOTH FINISH"

MODEL 6

BECAUSE:

The table is rigidly supported throughout its entire working length, keeping the work permanently aligned with the spindle.

The Becker Internal Belt Drive displaces the transmission gears with their attendant, destructive vibrations and by forming an elastic drive to the spindle, prolongs the life of the cutter through elimination of chatter. This gives the smooth finish for which the Becker is famous.

The stringent code of tests, through which every Becker machine must pass, insures perfection through perfectly made parts accurately assembled.

For accuracy, economy and productive ability, specify Becker Belt Driven Millers.

Oxy-Acetylene Welding and Cutting

Strength and Neatness in Manufacturing and Repairing

This illustration shows a Prest-O-Lite operator welding parts in the factory of the Packard Motor Car Co., where neatness and strength are essential.

The Prest-O-Lite Process of Oxy-Acetylene welding has been adopted as standard practice in thousands of factories, mines, machine shops and shipbuilding plants, both in Canada and the States. In the production end, this process results in increased strength with reduced weight in vital parts, while effecting substantial savings in cost.

Prest-O-Lite PROCESS

is not limited to production work. Its value in repairing is universally acknowledged. Worn and broken metal parts are quickly reclaimed and put back into useful service, avoiding costly tie-ups and delays. The actual saving on one Prest-O-Lite repair often more than pays for the entire welding outfit.

The Prest-O-Lite Process employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene (ready to use) is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Manufacturers, mining and production engineers will find our welding literature full of valuable data and helpful suggestions. It may help *you* to reduce your costs and improve your methods. Write for it *to-day*.

Manufacturing Opportunities

A large plant idle since shell making stopped, for sale at a very low price. Can be utilized for many lines of manufacture. : : :

TOTAL FLOOR SPACE 109,500 SQ. FT.

TOTAL AREA OF PROPERTY NINE ACRES

This large plant, consisting of three separate buildings, approximately 1,000 ft. long, with a width of from 50 to 140 ft., has a floor space of about 109,500 sq. ft., and with an area of nine acres gives ample room for storage or expansion. Railway running across the property. Building in foreground of above cut built in 1918—frame construction—contains 85,000 sq. ft.; building in centre, built in 1909—brick construction—built for a stove foundry—has a cupola—contains 18,380 sq. ft.; building in background built in 1916—frame construction—contains 5,520 sq. ft. These three buildings can be used separately, each for a different line of manufacture. Price for entire property, $50,000.00.

The Town of Pembroke is situated at the junction of the Ottawa and Muskrat Rivers, and is favorably located between the East and the West, being on the main line of three transcontinental railways; has good water supply, good homes, good schools.

Unlimited Hydro-Electric power obtainable at very low rates. There is a plenitude of labor available, both male and female. An unrivalled opportunity for an industry to start up with a small outlay.

For further particulars and plan of buildings, apply to

The City of Welland

offers Every Advantage to Industry

ONE YEAR'S RECORD

The following are extracts from the Welland Industrial Commissioners' report for the year 1918:

Our manufactured product valued at $35,400,340, a substantial growth over the previous year.

Over a million and a half spent in factory buildings and equipment. Though Welland located three new industries last year, only one of these erected new buildings, yet in all $470,771 was spent in new factory buildings and $919,281 in new equipment.

Payrolls exceeded $6,000,000.
In the pay envelopes of Welland's industrial workers there was placed last year $6,466,221, about three times the amount of 1915.

The second year that the City of Welland has been a leader in population growth.
Welland had a gain in population last year of 10.6 per cent., a record that was approached by only one other Ontario city, and, with this one exception, over double the percentage gain of any other Ontario city.

Welland fifth city in Customs Returns. In every hundred dollars collected in customs duties in Canada last year, one dollar was taken in at the Port of Welland.

The Destiny of Welland.

The compilation of our industrial statistics lends a new weight each year to the common prophecy that the City of Welland is destined to be one of the first manufacturing centres of Ontario, and the zone of the Welland Ship Canal, the workshop of the Dominion. Be sure to write for complete details and investigate Welland thoroughly before deciding definitely on your new location.

For particulars, write—

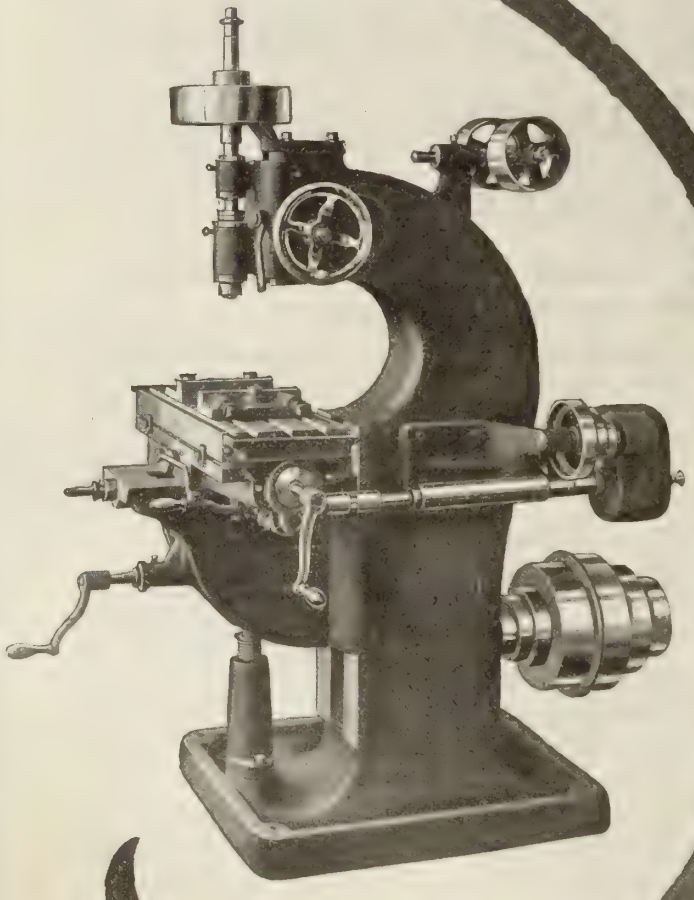
BRISTOL

Bristol Vertical Milling Machine

A Tool of Large Capacity



Ball Bearings are used at the most important points making it a free running tool, which, combined with its being a belt-driven machine, makes it capable of turning out work on which an extra smooth finish is desired.

The longitudinal table feed is controlled by the gear change box which gives six different feeds for each change of spindle speed. A stop to gauge with micrometer adjustment is used on the head to regulate the depth of cuts.

Learn all about its production capacity.

Write for bulletin giving fullest particulars.

BRISTOL MACHINE TOOL CO.

BRISTOL, CONN.

The Greenfield Universal Grinder

For General Tool Room Work

This grinder is furnished with attachments for grinding all sorts of milling cutters, reamers, counterbores, and other machine shop tools.

It is also suitable for cylindrical, internal and flat work which frequently turns up in the making of tools and jigs.

These attachments are all very simple in design and easily adjusted upon the machine, being graduated so that any desired angles can be at once obtained.

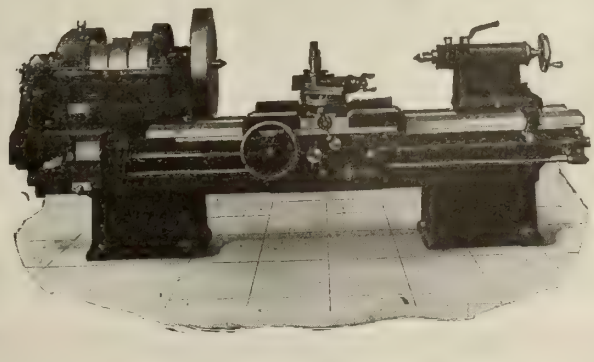
The whole machine is thoroughly well built, well finished, and will be found a dependable, convenient grinder.

Greenfield Machine Company,
GREENFIELD, MASS., U.S.A.

SIDNEY

Sidney for Service

Sidney-for-Service Lathes are noted for their power and rigidity. Take deep cuts through toughest metal without pause or chatter.



Specifications include 3-step cone, double back gear, semi-quick change gear lathe, built on 10 ft. bed. This lathe also furnished with quick-change gears. Bed lengths available: 10, 12, 14, 16, 18 and 20 feet.

The Sidney Line comprises 15-inch, 17-inch, 19-inch, 25-inch, 27-inch, 30-inch and 36-inch lathes, which are adaptable to the finest tool room work or the heaviest duty shipyard or factory rapid production work.

Clipper
Clipper Belt Lacer Co
REGISTERED TRADE-MARK

Industry and "Clipper" Belt Lacing

ONE hundred thousand Clipper Belt Lacers stand guard, ready for instant duty, in ninety thousand of the world's largest industrial plants. During strenuous years the Clipper kept the wheels of industry turning safely and economically—kept production at the maximum. Loss of time through breakage or adjustment of belts was reduced to the minimum.

There will be no lagging in this year's production—or in the years to come—where the Clipper stands guard to keep the belts of industry moving.

The Clipper Belt Lacer
Laces a Belt in Three Minutes

Before the adoption of the Clipper way of quick belt lacing it took from fifteen minutes to half an hour to make even an inferior joint. No wonder manufacturers hailed the efficient Clipper. No wonder it has been so universally adopted.

Not one but a number of Clipper lacing tools are used in many plants—distributed at convenient points for instant emergency use. No especial skill is required to lace a belt with the Clipper. Any workman can do it.

The Clipper makes a durable and perfect joint—one that pulls better and is safer—that is, flush with the belt on both sides and is as flexible as the belt itself.

The Clipper goes to manufacturers on free trial. It is backed by a perpetual guarantee.

The American Museum of Safety gave the Clipper the only gold medal ever awarded for metal lacing.

The Clipper will as effectively solve your belt lacing problems as it has done in so many other manufacturing plants.

Some mill supply dealer in every city sells the Clipper.

European trade supplied through London office, No. 10 Norfolk St.

Distributors in all parts of the World.

Peerless HIGH SPEED

Has Proven Its Efficiency Where Others Have Failed

DON'T turn down the "Peerless" because you have tried out other hack saws which did not answer your requirements.

Many concerns who were persuaded only with the greatest difficulty to try their first "Peerless," because they "just knew it would turn out like the others," are to-day among the largest and best-satisfied users of our High-Speed Saws.

The "Peerless" is different—and better. It does 50 to 100 per cent. more work, cuts with thinner saws and requires a minimum of attendance, saving time, labor, material, blades and floor space. What is your work? We can tell whether the "Peerless" will do it, and back our judgment with a 30-day trial. If it doesn't make good we pay freight both ways. Well?

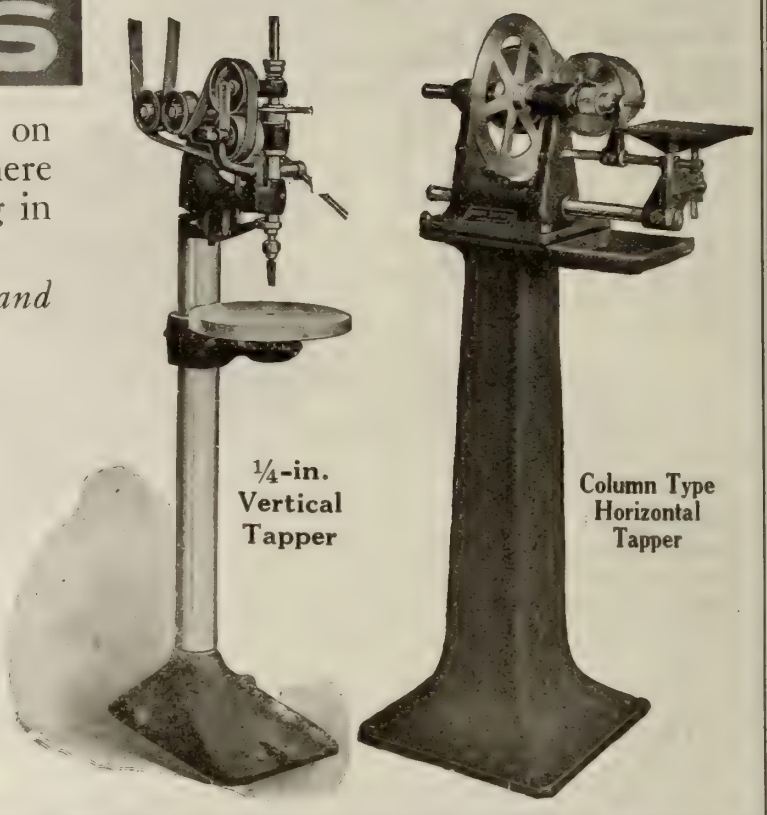
RICKERT-SHAFER TAPPERS

Save Tap Breakage

The *smooth drive* reduces the strain on the taps—they wear longer—and there are fewer delays from taps breaking in the work.

R-S Tappers ensure faster tapping and quicker assembling.

Friction drive, absorbing all the shock, allows a chuck speed of 140 r.p.m. on ⅝-in. work—50 per cent. faster than the usual tapping speed for that size. Uses but 1 h.p.



¼-in. Vertical Tapper

Column Type Horizontal Tapper

The Know-How of Making A Drill

Twenty-five years of study and practice have given the Hoefer Manufacturing Company the knok-how of making a driller.

And know-how is a lot different from know-it-all. The Hoefer engineers are eternally plugging away to make a better driller.

This is the spirit you'll like in Hoefer service.

If you will set your drilling needs before us, we'll give you the benefit of twenty-five years' contact with some of the drilling problems of the biggest manufacturers in the country.

Our product, Hoefer Drillers, embodies the latest word in design, efficiency and accuracy.

Regardless of the size of the press, drilling is possible to a fine degree of precision, provided you use Hoefer Drillers, the recognized standard for a quarter of a century.

Photographic Copying
The PHOTOSTAT

(Trade Mark Registered)

"Orders are now delivered three or four days earlier to our customers by making photographic copies of sketches and drawings which are the same in every detail instead of having our draftsmen reproduce the original.

"Practically all orders were previously held up three or four days by our drafting department while copies of the intricate drawings of ordered tools were being made. Now with the Photostat, only 15 or 20 minutes are required to make the three copies, exact duplicates of the original, which the factory needs to turn out the order. By eliminating this needless delay we are able to provide better service for our customers, and attract new prospects because of prompt deliveries."

This cut shows a PHOTOSTAT on which a large drawing has just been copied in less than a minute.

Never Makes a Mistake

It is simple, practical, easy to handle. Requires no expert knowledge. The machine is loaded with a roll of sensitized paper especially manufactured for the purpose.

The original subject is photographed directly upon this paper producing a facsimile copy which is immediately cut off, developed and fixed right in the PHOTOSTAT itself.

The focusing, exposing and developing are all controlled by simple mechanical devices and no glass plate, film or other intermediate negative has to be made.

After fixing, the copy is removed to a tank of running water and rapidly washed free from chemicals. It is then dried and is ready for use. As many copies as desired may be run off in this manner.

By a simple adjustment of the mechanical focusing device the copy may be made at actual size, reduced, or enlarged, within the size limitations of the machine.

Error in copy is impossible because every copy is an absolute facsimile. The operations are all simple, such as a boy or girl can do.

UNION

POSITIVE DRIVE DRILL CHUCKS

The Union Drill Chuck is made in seven sizes (0 to 2 inches) with PATENT TRANSVERSE SLOT—so that drills with tenons can be inserted (see illustration). The shank of drill should be squared on two sides to enter the TRANSVERSE SLOT, giving a positive rotation to the drill independently of the jaws, permitting the jaws to centre and align the drill accurately. The drill is held absolutely true and will not slip under the hardest strain. This type of chuck will be found to give the best results on all classes of work from HIGH SPEED drilling to the hard BLACKSMITH and GENERAL REPAIR work.

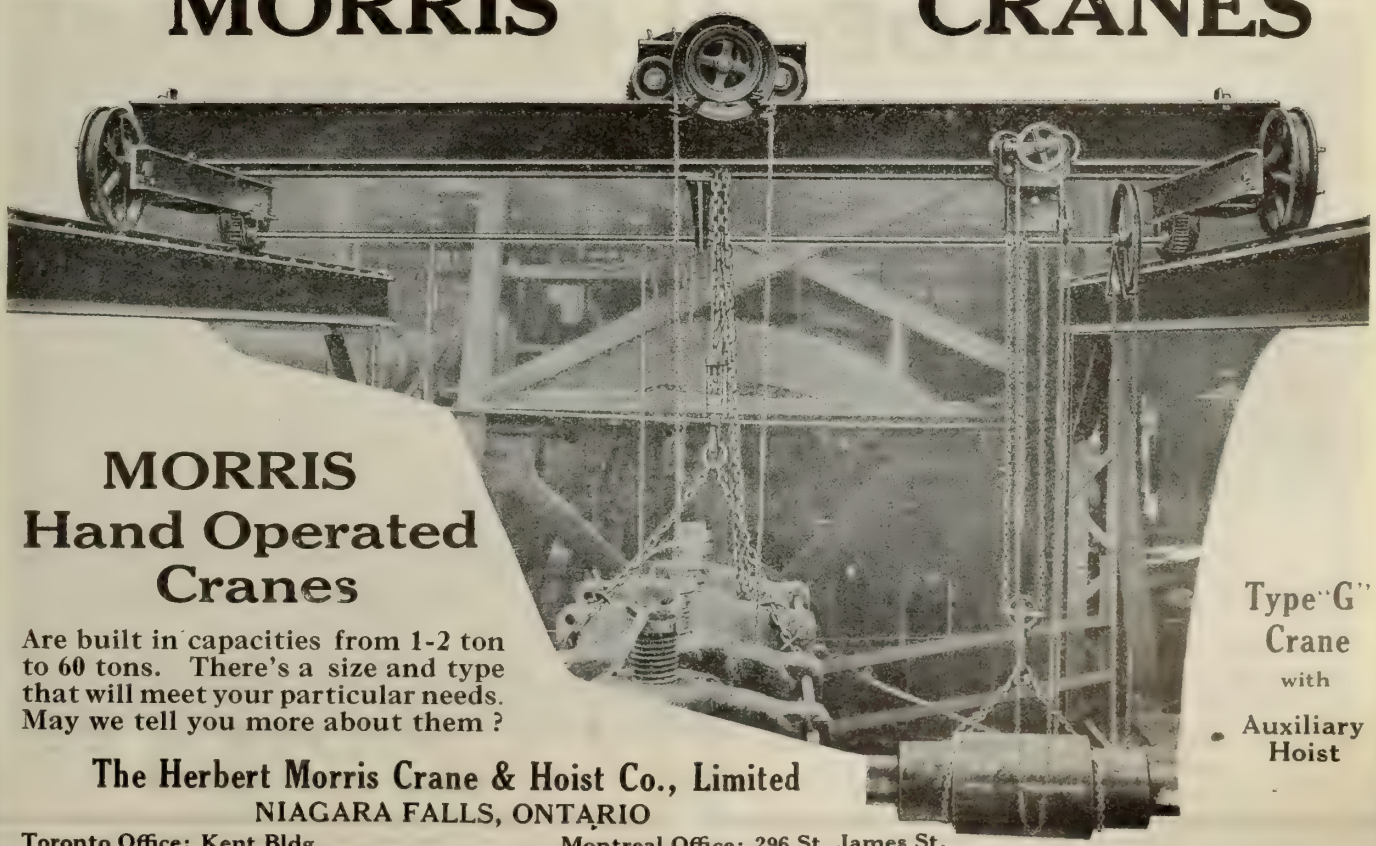
BRAZIL INDIANA U.S.A.

MORRIS CRANES



MORRIS Hand Operated Cranes

Are built in capacities from 1-2 ton to 60 tons. There's a size and type that will meet your particular needs. May we tell you more about them ?

Type "G" Crane with Auxiliary Hoist

The Herbert Morris Crane & Hoist Co., Limited
NIAGARA FALLS, ONTARIO

Toronto Office: Kent Bldg. Montreal Office; 296 St. James St.

TRANSVEYORS
Did It!

Castings by the hundreds—yes, by thousands—all easily, rapidly and efficiently transferable with the Transveyor.

Not on the floor, but on wooden platforms, or on skids made instantly mobile by elevating the Transveyor under the loaded skid—that is Transveyor transfer.

Despatching and storing material the Transveyor Way, promotes system, saves time and labor through the elimination of rehandling; reduces "overhead" cost.

Any business with a floor under it can beneficially apply Transveyors. Our latest machinery bulletin is yours for the asking. To what address shall we send it?

COWAN TRUCK COMPANY
15 Water Street, HOLYOKE, Mass.

Canadian Agent: R. B. SMILEY, 120 Glenholme Ave., Toronto, Ontario, Canada

IMPERIAL CARBIDE

For Welding Cutting and Lighting

HIGHEST GAS YIELD
IMPERIAL CARBIDE
MADE IN CANADA

Manufactured by

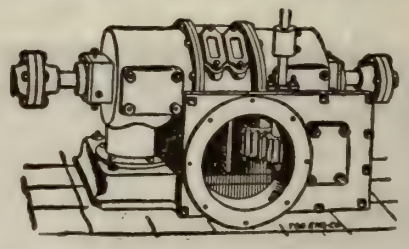
Union Carbide Co. of Canada, Ltd.

Head Office:
Dominion Bank Bldg.
TORONTO, ONT.

Works:
WELLAND
ONT.

Large Stocks maintained at convenient distributing centres throughout Canada

WATER POWER DEVELOPMENT



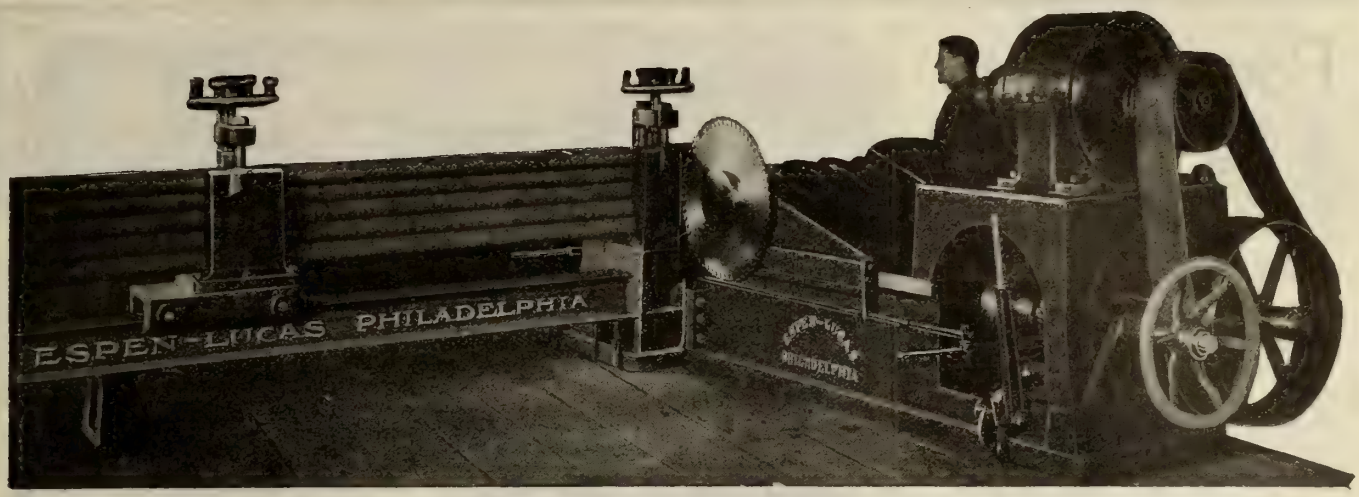
Over forty years' experience in designing and installing special turbines, both on vertical and horizontal shafts.

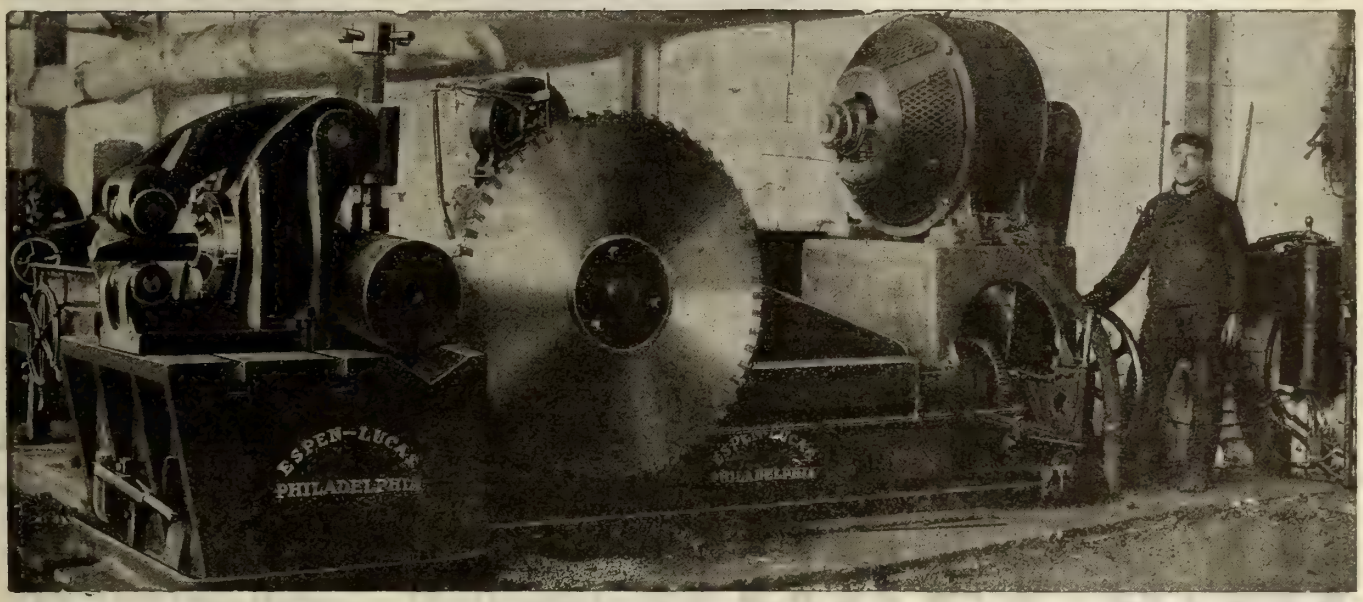
Can supply complete equipment, including flume, turbine and power transmission.

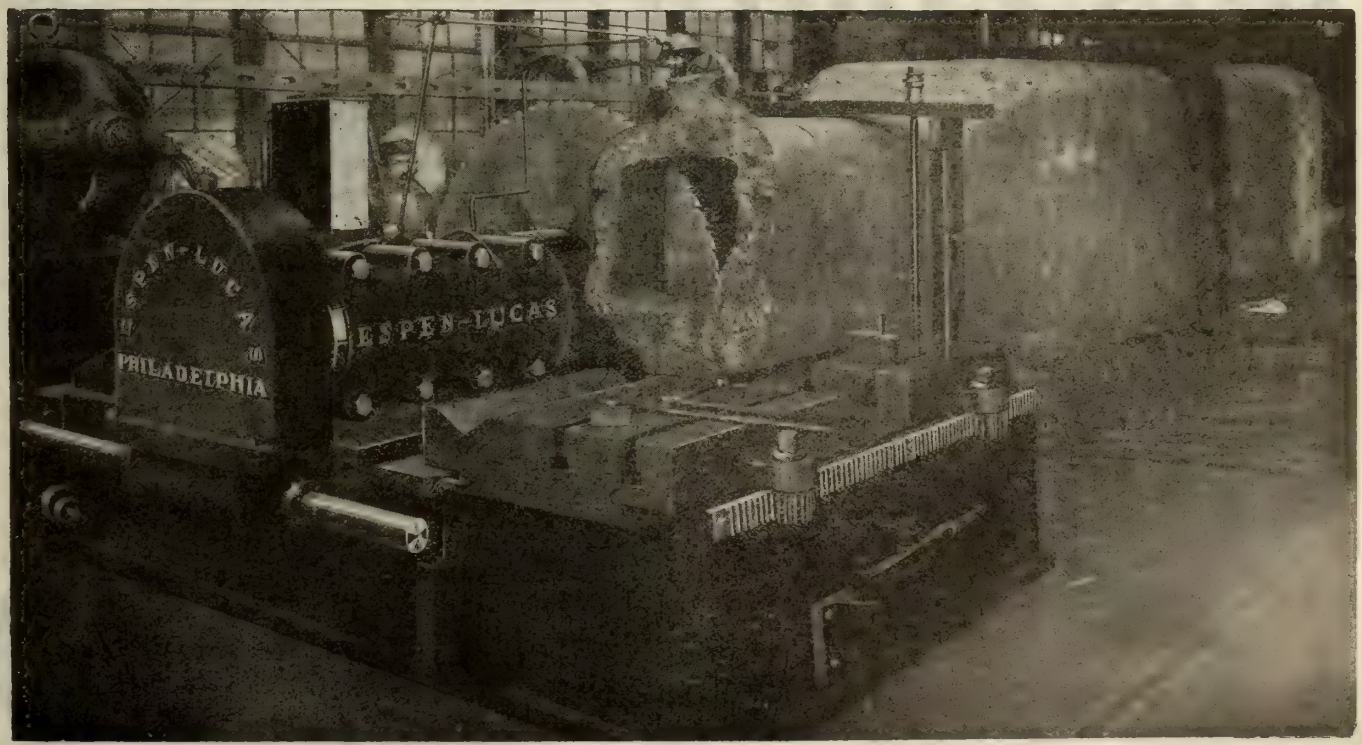
Stock of standard vertical shaft Little Giant Turbines on hand for prompt shipment.

We solicit your inquiries.

J. C. WILSON & CO.
BELLEVILLE, ONTARIO





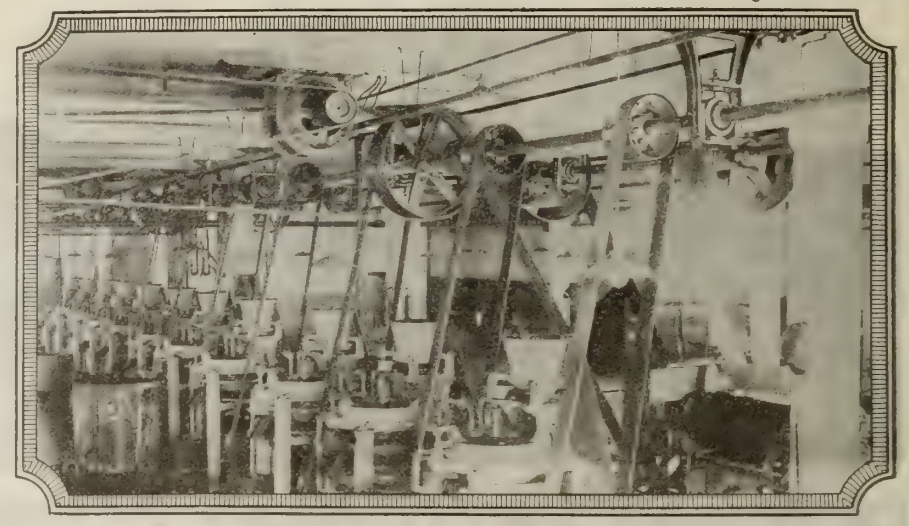


THE ESPEN-LUCAS MACHINE WORKS, FRONT & GIRARD AVENUE PHILADELPHA, PENNA., U.S.A.

Power Losses

Belt slip, air fanning, too heavy pulleys—account for losses of hundreds to thousands of dollars in many plants throughout the country.

Check these power and fuel losses. Reduce belt slip and windage (air fanning) to a minimum. Make every ton of coal do full duty by installing



AMERICAN STEEL SPLIT PULLEYS

There are no "ifs" about these pulleys. They are **guaranteed** to minimize belt slip and wind resistance. They are guaranteed for double belt duty. They are recommended for rim speeds up to 6,000 feet per minute. There are over 4,000,000 in use because they transmit more power with less waste than any other pulley in the market.

National distribution through supply houses from parent stocks in larger cities.

Write for 37-page book "Getting Maximum Pulley Efficiency." It will tell you how to eliminate pulley waste.

The American Pulley Company, - Philadelphia, Pa.

BERNARD

is the Canadian-made Clutch—reliable, safe and modern.

There Is No Better Friction Clutch

Some cost more **because they are imported.** But, foreign or Canadian-made, no other clutch will give better satisfaction. Let us know your requirements.

Orders quickly filled.

The A. Bernard Industrial Co.

Manufacturers of High Grade Power Transmission Appliances

Office and Works: Fortierville, Quebec, Canada

Philadelphia GEAR Works

VINE STREET PHILADELPHIA, PA.

Spur, Bevel, Spiral, Herringbone and Intermittent

GEARS and PINIONS

Made in all kinds of metals, rawhide and fibre

SOCKET WHEELS
MADE TO ORDER

DISTRIBUTORS OF
DIAMOND CHAINS

For Power Transmission, Machinery and Motor Trucks, Motor-Cycles and Bicycles.

We ship gears to all parts of Canada. Write us when you want good gears, good service, good prices.

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

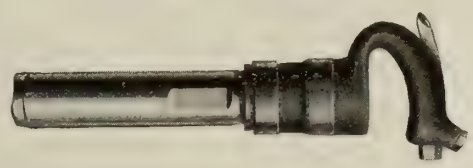
NEW Cleveland POCKET-IN-HEAD Riveter

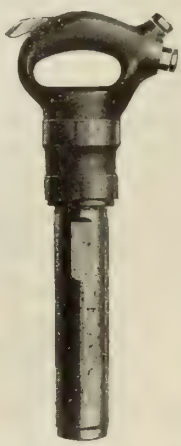
NEW CLEVELAND "POCKET-IN-HEAD" RIVETING HAMMER MOST POWERFUL RIVETING HAMMER ON THE MARKET

NEW Cleveland POCKET-IN-HEAD Riveter

The New Cleveland is shorter over all. Hits a harder blow, and uses less air than any hammer made.



The New Cleveland has a higher speed with less recoil in operation than any riveter on the market.



We can prove it in your shop

THE NEW CLEVELAND is made in 15 sizes with Outside or Inside Latch, and is adapted to all classes of work upon which Riveting Hammers can be used.
THE NEW CLEVELAND has a driving range in rivets from ¼-inch to 1½-inches, and is especially adapted for heavy riveting in Boiler or Structural Work.
IN STOCK: Riveting Hammers, Chipping Hammers, Air Drills for Reaming and Tapping, Breast Drills, Sand Rammers—Floor and Bench, Corner Drills, Portable Air Grinders, Bowes Air Hose Couplings, etc.

Write for Bulletins Nos. 34, 38, 39

Bowes Air Hose Couplings

Standard Equipment Everywhere.

Air tight under all pressures. Quickly connected or disconnected.

Interchangeable in all sizes from ¼-inch to ¾-inch inclusive.

Shows Cleco Never-Slip Hose Clamps Attached to Bowes Couplings
Write for Bulletins 34A, 41 and 43

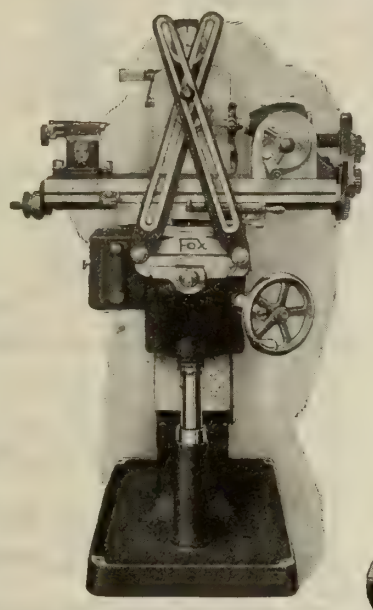
MILLING MACHINES

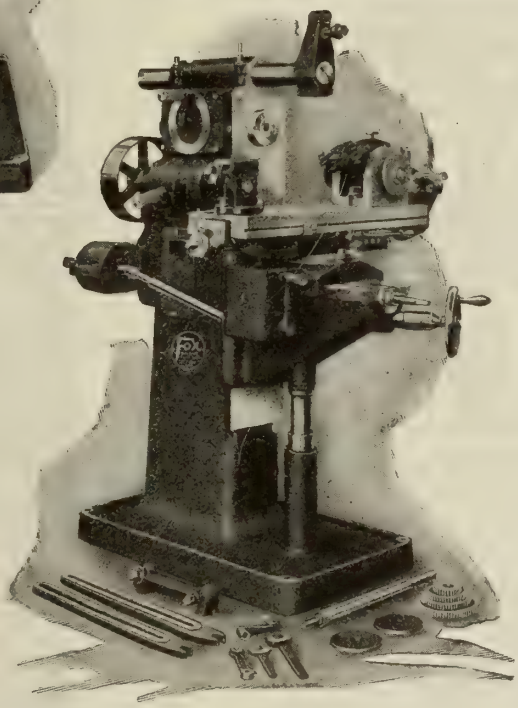
FOR

Rapid Production of Motor Parts



The **demand** for increased production **requires tools** of **great strength** and **durability**; the Fox 2-A Universal Milling Machine illustrated has met this demand, and is being used wherever extreme accuracy and quantity production are required.

The machine has a universal table, spiral cutting attachment, 10″ Dividing Head with 6″ Universal Chuck, making it a machine **especially adapted for Tool Room Work.**



The **United States Government** used this machine in its various **repair shops** for **Aeroplane Motors.**

You should be using this tool to help the production of parts necessary for reconstruction.

Specifications—No. 2-A Miller.

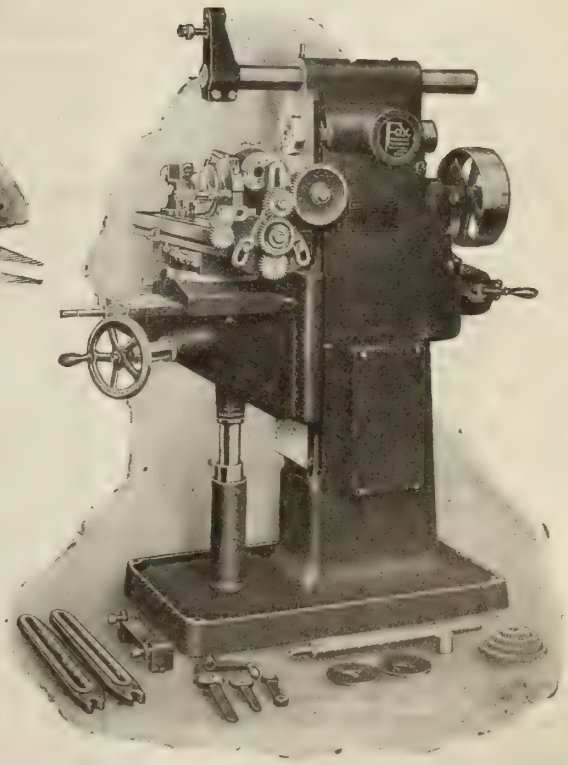
Spindle speeds 12
From 21 to 423 r.p.m.

Table feeds 6
From .317″ to 2.79″ per min.

Table .....8½ x 27″
Long. feed (power) 26″.
Vertical feed (hand) 13″.
Trans. feed (hand) 8½″.

Drive...Single pulley 10 x 3″ running 250 r.p.m.

Gears — Hardened steel.
Weight .....1,500 lbs.



We build this same machine with a plain table, omitting the spiral cutting attachment and Dividing Head.

Our No. 1 type machine has a four-step cone drive, and while being a lighter machine is a "bear" for work. This was proven by **the hundreds** of **them in the largest munitions plants.**

We also build the Fox Multiple Spindle Drilling Machines.

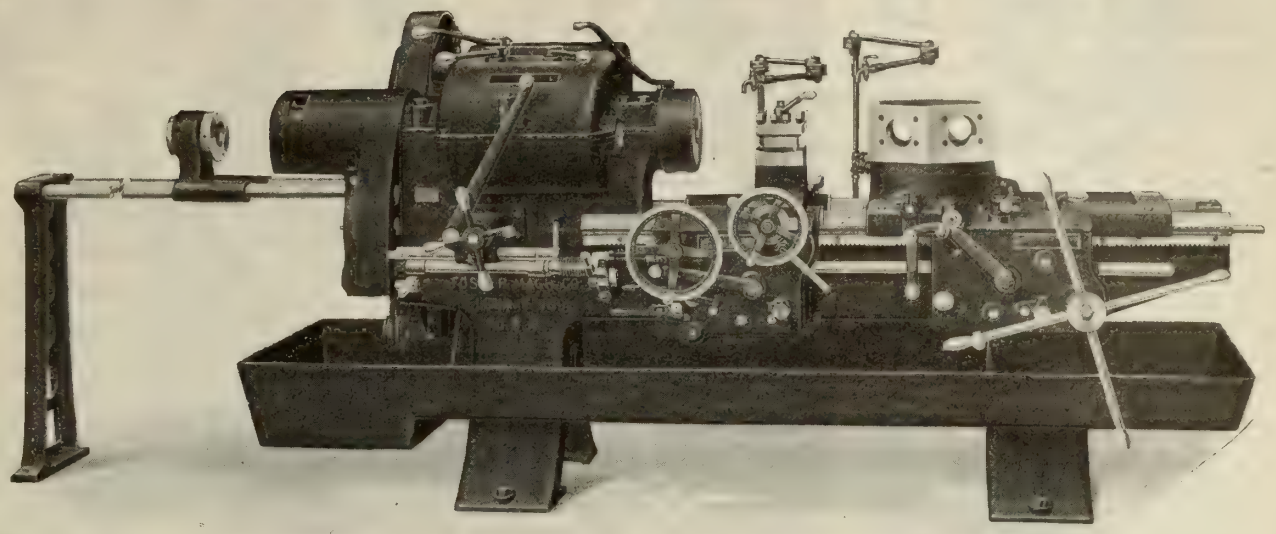
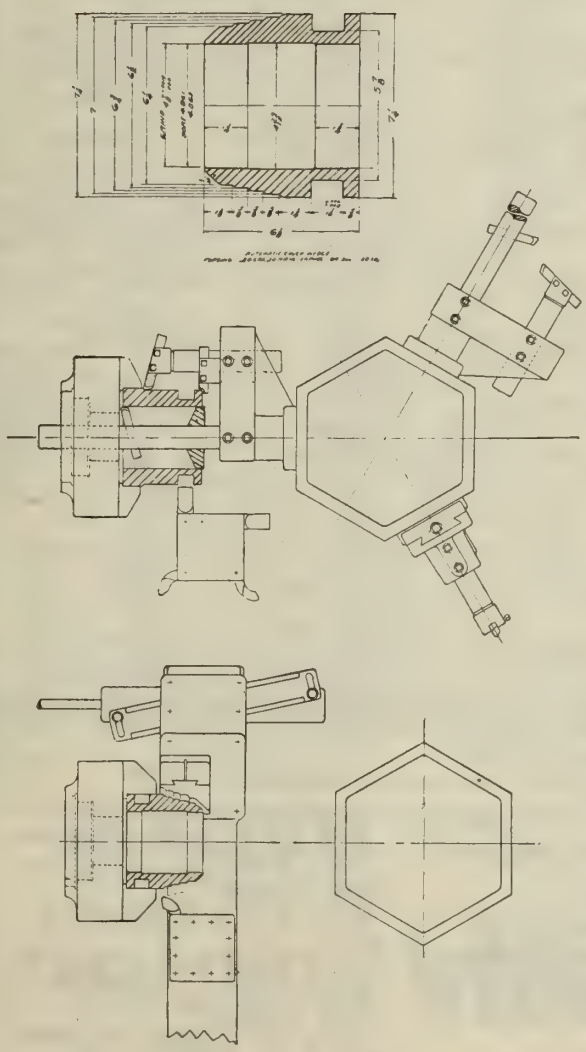
THE FOSTER METHOD





Machining an Automatic Chuck Wedge on the Foster 2-B Universal Turret Lathe

The line drawing shows the Foster method of machining a large automatic chuck wedge.

The material used is a hollow forging. This is gripped in a three-jaw scroll chuck. Two cutters carried by a Multiple Turning Head on the hexagon turret, bores and rough turns the piece while a cutter in the square turret on the cross-slide roughs the face.

Next, cutters carried by a second Multiple Turning Head finishes the bore and outside and rounds the corner and a square turret tool finishes the face. A centre on the Multiple Turning Head supports the work, while square turret tools rough and finish the slot. The recess is bored by a cutter in the slide tool on the hexagon turret.

For the second operation the work is gripped by soft jaws in the scroll chuck; a cutter in the square turret in conjunction with the taper attachment removes rapidly all the excess stock. The stepped portion of the wedge is then finished by a forming tool rigidly carried by a holder mounted on the rear end of the cross slide and the automatic wedge is finished.

Trace these operations through again and see how the multiple tooling idea, as applied to this piece of work, saves time—and money.

How about your own work? There are a lot of parts in your factory where multiple tooling can save you time and increase production. Send us your blue prints. Let us study it over and show you how.

THE FOSTER LINE

No. 1-B UNIVERSAL TURRET LATHE
Bar Cap. 2" — Swing over Carriage, 14" over Cross Slide, 8"

No. 2-B UNIVERSAL TURRET LATHE
Bar Cap. 3¼" — Swing over Carriage, 20" over Cross Slide, 13½"

No. 3-B UNIVERSAL TURRET LATHE
Bar Cap. 4½" — Swing over Carriage, 26" over Cross Slide, 18¾"

No. 0 PLAIN HEAD SCREW MACHINE
Bar Cap. ⅞" — 10" Swing

No. 1 PLAIN HEAD SCREW MACHINE
Bar Cap. 1⅛" — 11" Swing

No. 2 PLAIN AND FRICTION HEAD SCREW MACHINES
Bar Cap. 1⅜" — 13" Swing

No. 3 PLAIN, FRICTION AND ALL GEARED HEAD SCREW MACHINES
Bar Cap. 1⅝" — 14½" Swing

No. 4 FRICTION HEAD SCREW MACHINE
Bar Cap. 1⅞" — 17¼" Swing

No. 5 FRICTION AND ALL GEARED HEAD SCREW MACHINES
Bar Cap. 1⅞" — 17¼" Swing
Nos. 6, 7, 8, 9, 10 FRICTION HEAD SCREW MACHINES
Bar Cap. 2⅛"; 2⅛"; 2⅜"; 2⅝"; 3⅛" resp. — 20" Swing

No. 2 FRICTION HEAD UNIVERSAL TURRET LATHE
Bar Cap. 1⅜" — 14" Swing

No. 2 FRICTION SET-OVER TURRET LATHE
Bar Cap. 1⅜" — 14" Swing

No. 3 FRICTION HEAD UNIVERSAL TURRET LATHE
Bar Cap. 1⅝" — 16" Swing

No. 3 FRICTION HEAD SET-OVER TURRET LATHE
Bar Cap. 1⅝" — 16" Swing

Lifts Anything (up to 30 tons) Anywhere

Wherever there is anything heavier than 50 lbs. and lighter than 30 tons, to be lifted or lowered, whether on land or sea, or in the bowels of the earth, one of three types Wright Hoists will do the work, quicker, better and at less cost.

Wright Hoists are made better; that's why they serve better.

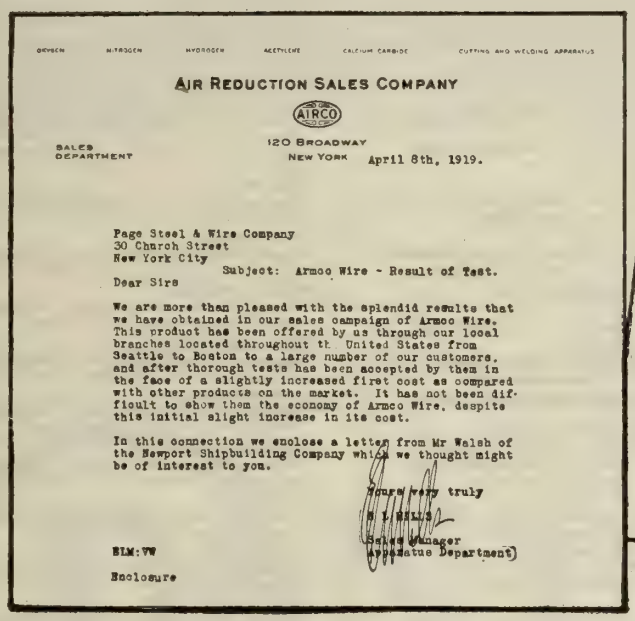
ARMCO IRON WELDING RODS

AMERICAN ARMCO INGOT IRON

The trade mark ARMCO carries the assurance that iron bearing that mark is manufactured by the American Rolling Mill Company with the skill, intelligence and fidelity associated with its products, and hence can be depended upon to possess in the highest degree the merit claimed for it.

cost somewhat more than ordinary filling material, but, compared with the total cost of the weld, the difference is insignificant. The difference in strength and safety of the weld, on the other hand, is of vital importance.

"It has not been difficult to show them the economy of Armco Iron Wire—"



OXYGEN NITROGEN HYDROGEN ACETYLENE CALCIUM CARBIDE CUTTING AND WELDING APPARATUS

AIR REDUCTION SALES COMPANY

AIRCO

SALES DEPARTMENT 120 BROADWAY NEW YORK April 8th, 1919.

Page Steel & Wire Company
30 Church Street
New York City

Subject: Armco Wire - Result of Test.

Dear Sirs

We are more than pleased with the splendid results that we have obtained in our sales campaign of Armco Wire. This product has been offered by us through our local branches located throughout th United States from Seattle to Boston to a large number of our customers, and after thorough tests has been accepted by them in the face of a slightly increased first cost as compared with other products on the market. It has not been difficult to show them the economy of Armco Wire, despite this initial slight increase in its cost.

In this connection we enclose a letter from Mr Walsh of the Newport Shipbuilding Company which we thought might be of interest to you.

Yours very truly

H. L. Sills
Sales Manager
(Apparatus Department)

NEWPORT NEWS SHIPBUILDING AND DRY DOCK COMPANY

HOZIER L. FERGUSON, PRESIDENT AND GENERAL MANAGER

NEWPORT NEWS, VA., March 8, 1919.

Air Reduction Sales Co.,
120 Broadway,
New York, N.Y.

Dear Sir:-

Replying to conversation with your representative as to the success we are having with Airco Service and Armco Welding Iron.

I am pleased to advise, we are having entire satisfaction with both, and find they are most satisfactory for our numerous kinds of welding work.

During our recent war we were fortunate to have Airco Service and Armco Iron for our welding work.

Very truly yours,

HWW/ARE- Foreman, Welding Department.

The above typical letter to one of our distributors shows that the superiority and real economy of ARMCO welding material are readily appreciated. Welders who use ARMCO IRON exclusively have a big advantage over competitors who buy inferior filler and their customers soon learn the difference.

Another ARMCO advantage from the welder's standpoint is the fact that two kinds of rods of guaranteed ARMCO analysis, one specially treated for electric and the other for oxy-acetylene welding, do all the work (with better results) that heretofore has required a choice of one from many compositions. This means that with a much smaller investment for stock of filling material a shop is fully prepared to handle the usual run of steel and iron welding work.

Because of their exceptional purity and even density Armco Iron Welding Rods flow freely, weld evenly, and give a joint that lends itself perfectly to hammering, forging, and, where necessary, to annealing and quenching.

Our booklet on "Armco Iron Rods and Wire" is full of interesting and useful welding data. Send for it.

PAGE STEEL & WIRE CO.

Established 1883 as Page Woven Wire Fence Co.

STEEL AND WIRE PAGE QUALITY PRODUCTS

Makers of "Copperweld" Copper Clad Steel Wire; ARMCO Iron Welding Rods and Electrical Wire; Wire Mill Products, Plain and Galvanized; Wire of Special Analysis; Wire Fencing for all Purposes; Factory Gates; Ornamental Iron Fence; Machine Guards; Tool and Stockroom Partitions; Architectural Iron.

Plants: Monessen, Pa., and Adrian, Mich.

Sales Offices: 30 Church Street, New York

The

GRANT

Spins a Polished Rivet Head Every Second Without Noise

A dozen of these GRANT ROTARY RIVET SPINNING MACHINES going at full speed would not awake a light sleeper in the same room.

The GRANT is fast. In one second it will quietly spin a polished rivet head without breaking or in any way marring the casting. It will rivet tight or loose, as required. The GRANT boosts the output, cuts the cost, and turns out perfectly accurate work.

Pleased to tell you more about it. Write.

Grant Noiseless Rotary Rivet Spinning Machine

GILBERT & BARKER
FUEL OIL BURNING FURNACES

Delivered from Stock

Above photo shows G.&B. furnaces and quenching tank in the hardening room of a large manufacturing concern.

With this concern, as with hundreds of others, there is no lingering doubt as to whether they have adopted the proper heat treating apparatus, they **know** that G.&B. equipment and service is the **very best obtainable.**

Whether your heat treating problem is that of welding—forging—tempering—brazing—hardening or annealing, our expert engineers are ready to advise with you.

Send for catalog No. 24 to-day, for to-day is a better day than to-morrow — write.

New York Office, 26 Broadway.

Cast Nichrome "Sealtite" Carburizing Pot

With an iron pot, after the carburizing compound has been tamped into place, the edges of the top cover are sealed with fire-clay or asbestos cement, to keep the gases confined. This requires additional labor, and increases the cost of operation.

The "Sealtite" Carburizing Pot is a cast Nichrome pot fitted with a machined taper-fit cover. It minimizes the amount of carbonaceous material required, and lasts twenty-five to forty-eight times as long as a cast iron pot.

The "Sealtite" Pot reduces the cost of carburizing.

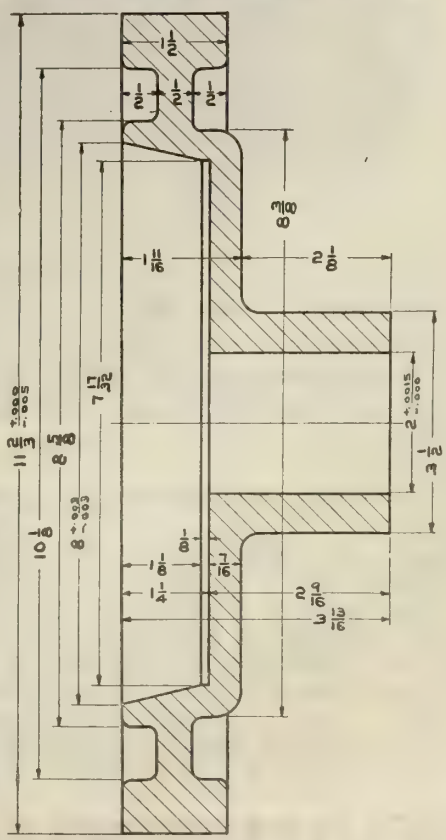
Universal Hollow Hexagon Turret Lathes

Rapid and accurate production is naturally expected when the Universal Hollow Hexagon Turret Lathe is installed for gear work. The carriage usually faces while the turret bores and turns both hub and rim.

Best for Gear Production

This cast iron friction gear blank is being finished on a No. 3-A Universal Hollow Hexagon Turret Lathe first because the accuracy possible on the machine is well within the limits specified, and second, the production of 13 per 10 hours is greater than had previously been possible on any other machine tested. Being adapted to gear production up to 17 inches in diameter, bronze, cast iron, cast steel or forged steel, this machine has won great popularity with practically all the large gear producers.

Our Engineering Department is ready to tell you what this machine can do for you. Send us your blue prints



2-A—Bar Capacity 2½" x 29" or 3¼" x 29".
Maximum Swing, 16½".

3-A—Bar Capacity 3½" x 44" or 4½" x 44."
Maximum Swing, 21½".

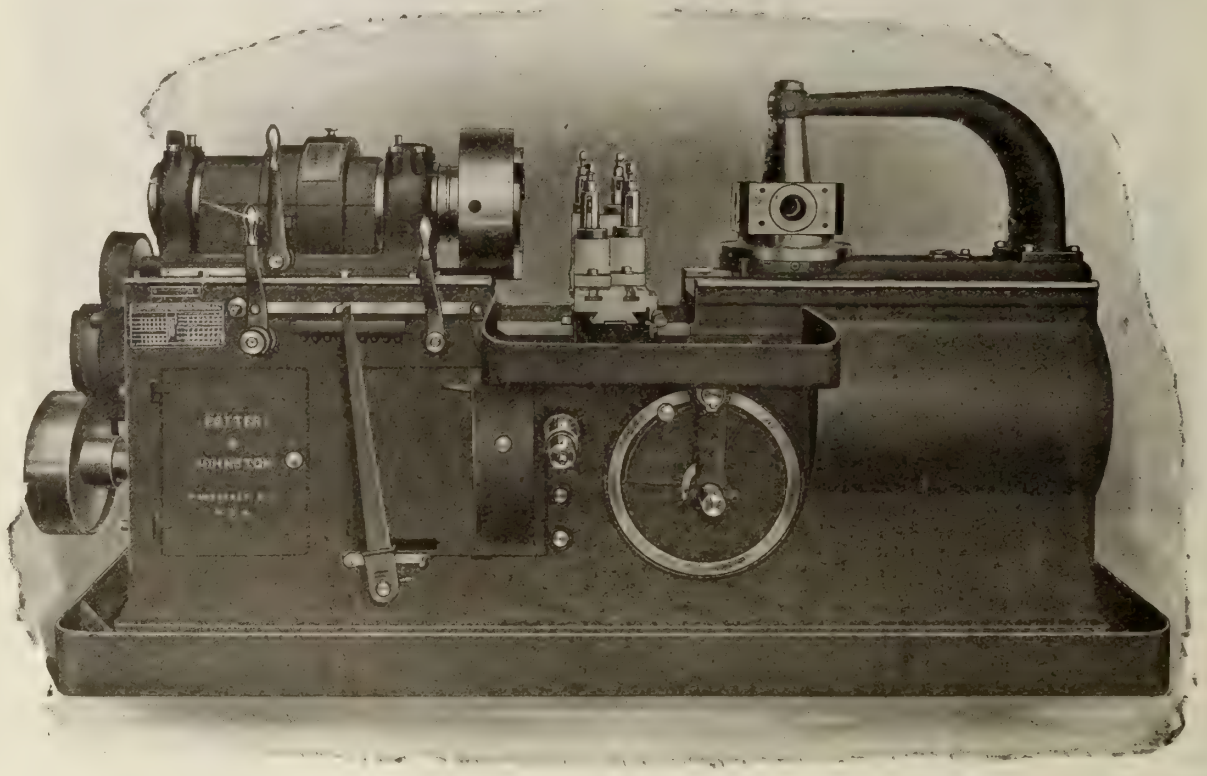
POTTER & JOHNSTON

MANUFACTURING AUTOMATICS

Increase the Output and Reduce the Cost



6-A Potter & Johnston Automatic Chucking and Turning Machine

6-A Potter & Johnston Automatic Chucking and Turning Machine

Geared head, having three automatic changes of spindle speeds.
Geared feed.
Auxiliary reaming and threading feed.
Cross slide.
Automatic back facer bar through spindle.
16-inch convertible two and three-jaw scroll chuck.
Spindle 5¾ inches diameter, hole 3½ inches diameter.

DO IT AUTOMATICALLY

All operations are entirely automatic. One attendant can readily run a battery of two to six machines.

In addition to automatically machining all varieties of castings from iron, bronze or steel, also forgings, the machines are also recommended and are widely used for finishing pieces from bar starch which have previously been cut off to length. This is a highly economical method of producing gear blanks, bushings, studs, etc.

Catalog gives full particulars. ***Drop a card for it.***

Boys, use these STOCO CELOGLAS SHATTER-PROOF LENS SAFETY GOGGLES

IT'S one of your most important duties to see that your workers in eye-hazardous positions are supplied with suitable eye-protectors. You cannot give them a better goggle than the Stoco safety goggle with Celoglas "Shatter-proof" lenses. It's a wonderful protection glass—staunch and durable and extremely comfortable in use. Your men will wear it willingly.

The Stoco safety goggle is made with easy cable earbows or with elastic headbands. The price with Celoglas lenses is $1.50.00 per hundred pairs; with heavy, clear optical glass lenses, $115.00 per hundred pairs.

STANDARD OPTICAL CO.

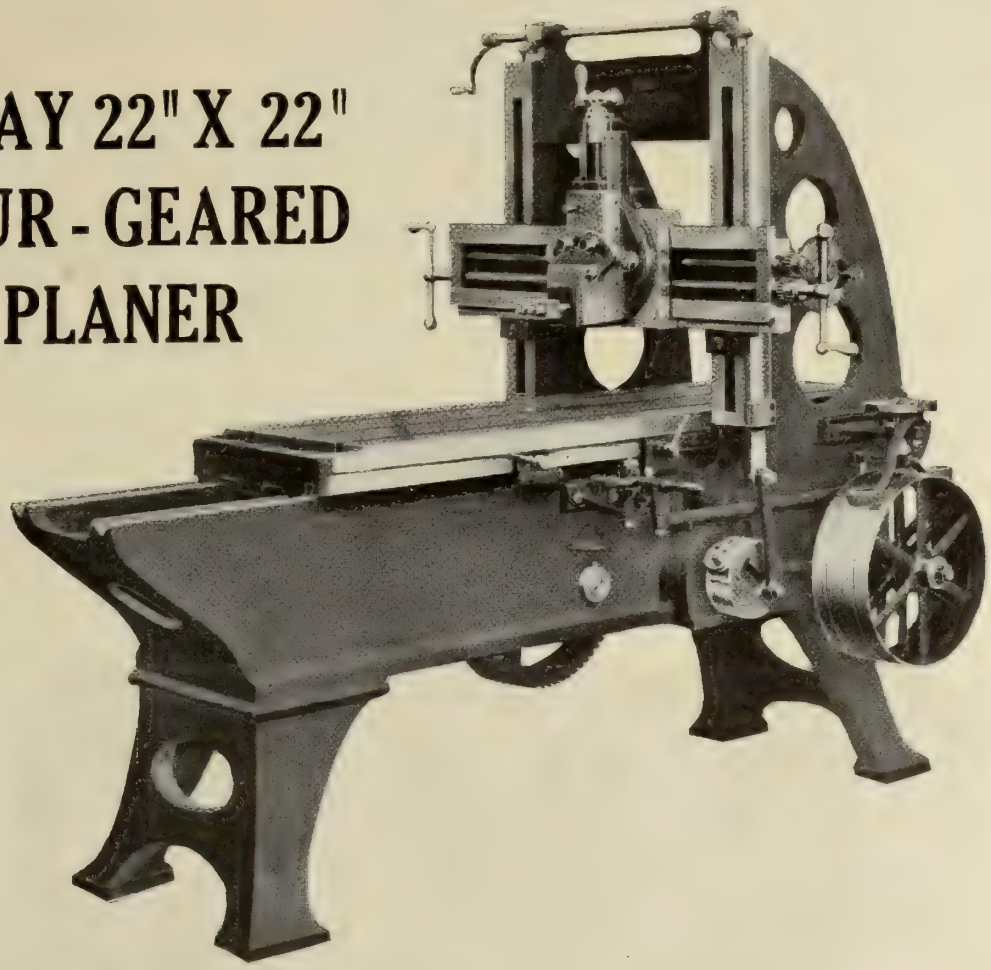
QUALITY Foss SERVICE

Foss MACHINERY AND MILL SUPPLIES

GRAY 22" X 22" SPUR-GEARED PLANER



Gray Planers are built by a firm that makes nothing but planers. They are given the entire time and attention of a large organization—and their performance shows it.

In designing this tool the parts have been so proportioned and the metal so distributed that the planer is quick acting and simple in operation, and yet sufficiently stiff, strong and powerful to perform a great portion of the work for which larger, heavier and more clumsy planers are ordinarily used.

May we send you full details?

Vol. XXII. No. 2 Publication Office: Toronto, July 10, 1919 Subscription Price $3.00 per Year

Skilled Artisans Prefer Standard Grade Tools

The skilled mechanic **must** have sharp files, otherwise he gets no satisfaction out of his work.

As soon as his file becomes dull tell him to turn it in and get a new one. The result will be better work and greater satisfaction to all concerned.

And it pays. New files cost little, labour costs much.

Good steel, accurate cutting and proper hardening insure long life to "Famous Five" files.

Specify them when ordering. They are:

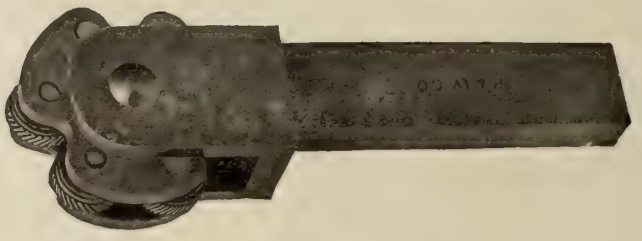
SMALL TOOLS

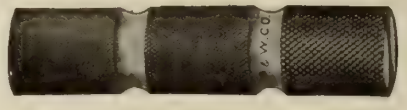
P. & W. Combination Lathe Knurling Tool



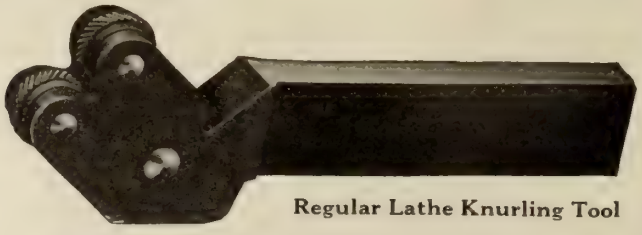
Combines Three Distinct Knurling Tools In One

You will save time by using this three-in-one Lathe Knurling Tool.

It carries three pitches of knurls fine, medium and coarse, as shown in sample. This does away with necessity of having three holders or of changing knurls where but one holder is available. Same knurls can be used in this holder as are used in our regular Lathe Knurling Tool.



FINE MEDIUM COARSE



Regular Lathe Knurling Tool

PROMPT SERVICE

is assured at our nearest store where P. & W. Small Tools are carried in stock. Place your order there to-day.

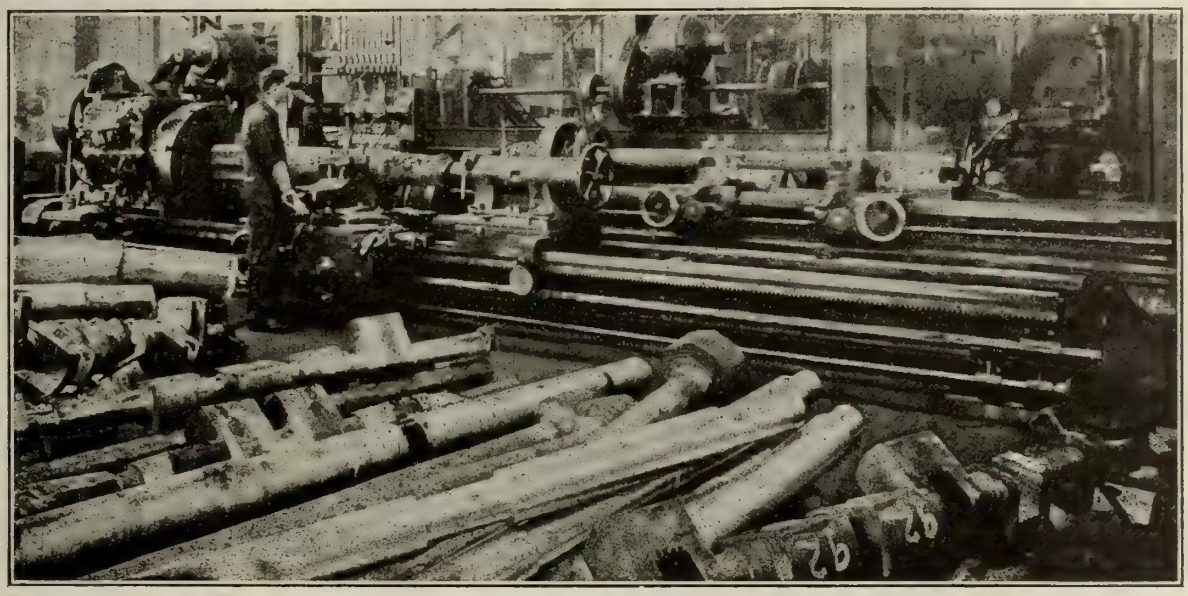
BRIDGEFORD

Heavy Duty Lathes



The above photograph shows a Bridgeford 27″ Manufacturing Lathe finish boring a cast-iron transmission housing for the new Fordson Tractor.

The diameter of housing is 19⅛″ and the limits of accuracy are .002″.

Maximum production is a requirement in the Ford plant and that is why a Bridgeford was selected to do the work. The Bridgeford turns out 80 pieces per day of 8 hours, which is excellent production.

There's a Bridgeford for every heavy duty lathe requirement. Bridgefords are in operation in all parts of the world on all kinds of duty. The line includes Heavy Geared Head Engine Lathes from 24″ to 72″ swing, Cone Driven Engine Lathes, Axle and Journal Truing Lathes and Manufacturing Lathes of 27″ and 30″ Swing.

Send for interesting data on Bridgeford Lathes.
We are in a position to make prompt deliveries.

BRIDGEFORD MACHINE TOOL WORKS 161 Winton Road Rochester, N.Y.

The Keystone Upon Which All WILT Products Are Built

A high standard of perfection is maintained throughout the various processes of manufacturing WILT High Speed and Carbon Twist Drillls, Reamers and Milling Cutters. WILT products improve production! This is no theory, no untested statement, but an established fact backed by many of the largest manufacturers throughout Canada. For steady, reliable output of work that is satisfactory from the standpoint both of quantity and quality there is no better choice than WILT Products.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25%; a different method of molding them might double your production at no increase in molding cost. **We can advise you** and we have expert metal and wood pattern-makers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us.

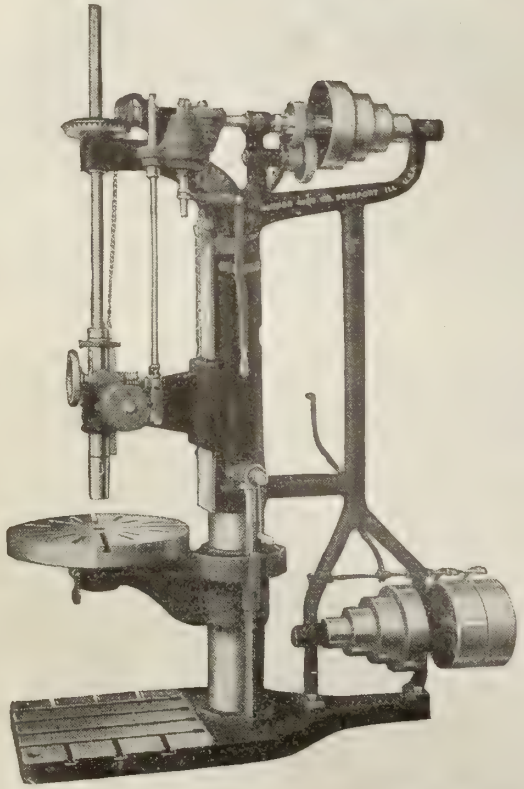
The Driller for Exact Work



HŒFER

Enable Your Workmen to Eliminate Spoilage

The Hoefer Driller is pre-eminently the one to be found in the best plants. "It's almost as good as a Hoefer," so often heard in the machine and tool trade, indicates the position held by Hoefer Drillers.

Exact drilling, to the last thousandth of an inch, pays by eliminating spoiled material. Hoefer Drillers pay for themselves and increase the workman's pride in his work.

Twenty-five Years on Market

Twenty-five years making drillers has given Hoefer the "Know-how." The Hoefer Drillers are used by many of America's leading manufacturers. Equip your factory the Hoefer way. Take any kind of a drilling problem you have to the Hoefer Manufacturing Company, and the Company's experts can tell you how it was solved by other men, some of whom you may know.

Investigate now. Write to-day for catalog. The Hoefer engineers are at your service.

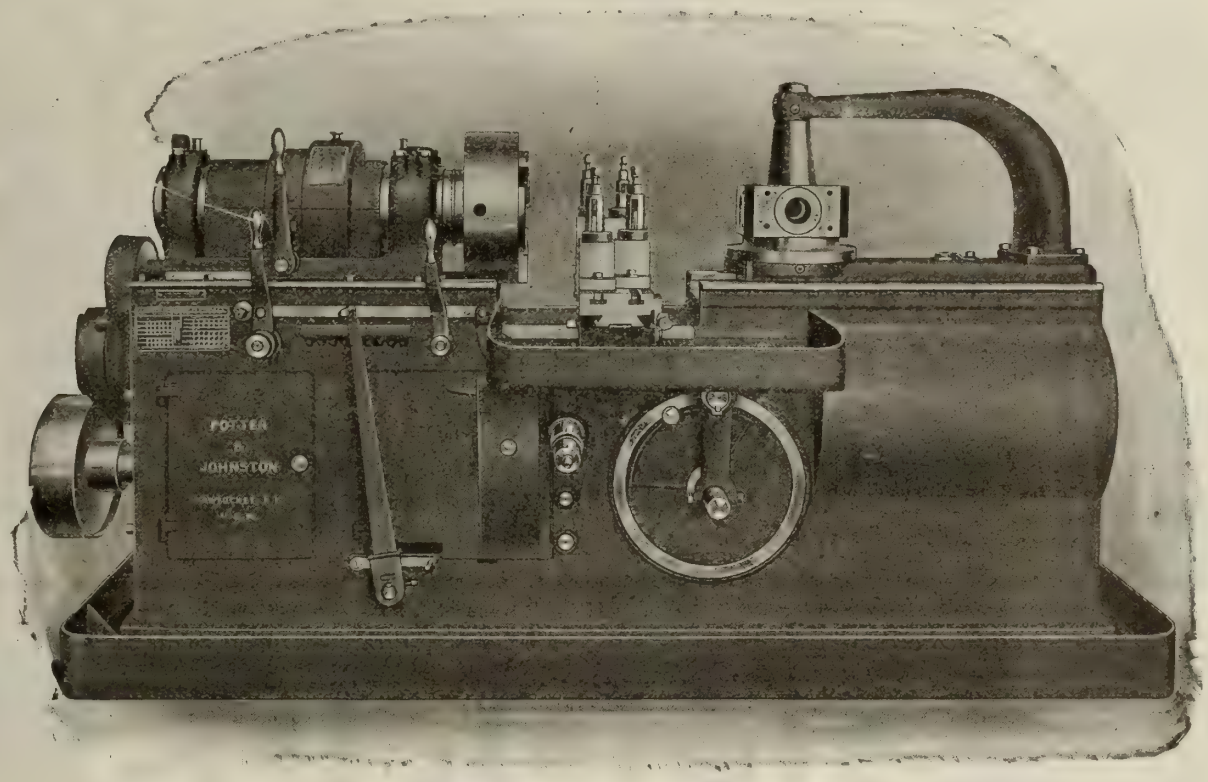
POTTER & JOHNSTON

MANUFACTURING AUTOMATICS

Increase the Output and Reduce the Cost



6-A Potter & Johnston Automatic Chucking and Turning Machine

6-A Potter & Johnston Automatic Chucking and Turning Machine

Geared head, having three automatic changes of spindle speeds.
Geared feed.
Auxiliary reaming and threading feed.
Cross slide.
Automatic back facer bar through spindle.
16-inch convertible two and three-jaw scroll chuck.
Spindle 5¾ inches diameter, hole 3½ inches diameter.

DO IT AUTOMATICALLY

All operations are entirely automatic. One attendant can readily run a battery of two to six machines.

In addition to automatically machining all varieties of castings from iron, bronze or steel, also forgings, the machines are also recommended and are widely used for finishing pieces from bar starch which have previously been cut off to length. This is a highly economical method of producing gear blanks, bushings, studs, etc.

Catalog gives full particulars. ***Drop a card for it.***

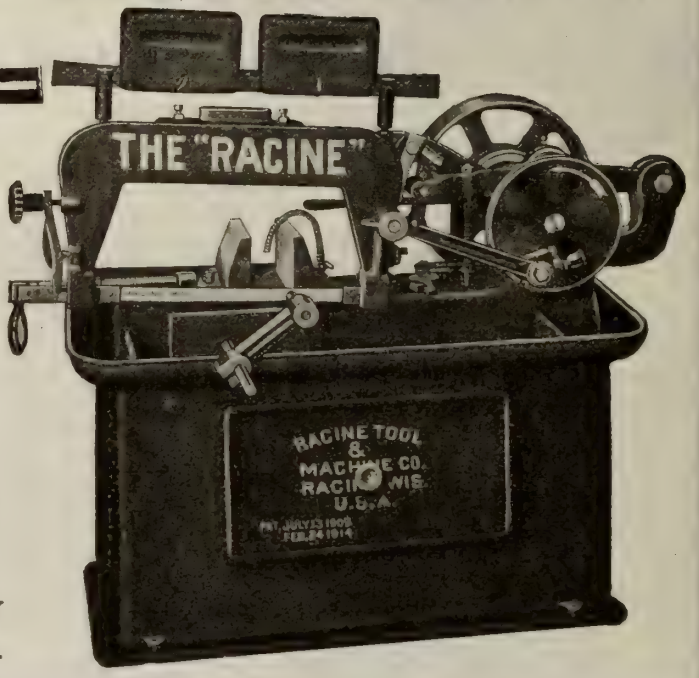
"THE RACINE"

High Speed Metal Cutting Machine

Standard the World Over

This is the only machine in the World that has an ABSOLUTELY POSITIVE AUTOMATIC LIFTING DEVICE, a feature secured by patents. Another feature is the rigid saw frame guide. These two assets combine to give long life to the cutting blades and save a lot of money.



"THE RACINE" minimizes wastage, cuts accurately and with great speed. Then they are easy and cheap to operate. These features are appreciated by the best shops everywhere and that's why "THE RACINE" sets the "Standard the World Over." Write for full particulars.

Use "RACINE" H.S. Tungsten-Power Blades.

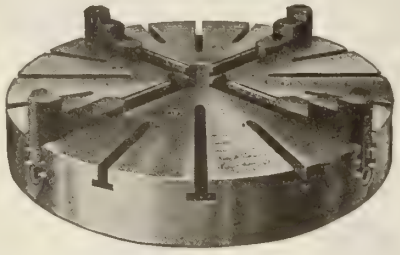
GOOD MECHANICS
Show preference for the
UNION INDEPENDENT CHUCK



It has an iron body, and is made heavy and strong. The double bearing ribs for the jaws make a stiffer chuck for heavy work than the ordinary single rib type.

The screws are also of the "socket" type and operate in hardened steel thrusts, which also add to the strength and stiffness of a chuck that is designed for **heavy duty.**

The jaws are wide and the screws are correspondingly large.

UNION MANUFACTURING CO.

BRISTOOL

Bristol 12-inch Rotary Precision Surface Grinder

Built for rapid production on grinding work.

It handles work either singly or in multiples within the capacity of the chuck and not thicker than 6-in., and grinds within quarter thousand in. of manufacturing accuracy.

And it is built to last.

It is provided with exceptionally long bearings throughout, especially in the back column. This prevents the wear, which is very slight, from affecting the accuracy of the grinder. The Back Column is made to swivel four degrees, which allows concave or convex grinding.

Bristol Rotary Surface Grinders are made in several types and sizes and are regularly equipped with 8-in., 12-in., and 16-in. magnetic chucks, either belt or motor driven and for dry or wet grinding.

Our Bulletin describes the many good points fully. Send us your name and address and we'll gladly mail you one.

Introducing

Williams' "Agrippa" Turning-Tool Holders Set Screw Pattern

To provide increased and abundant variety of selection in Williams' "Agrippa" line of Tool Holders, we offer this Set Screw pattern of Turning-tools primarily for those who use Cutters made of steel which has been hammered or rolled with a greater variation in size than is common to usual mill practice. But for the majority of users who purchase Cutters of accurate size, we recommend the original "Agrippa" Turning-tool of Cam Pattern as being stronger, more reliable and more generally satisfactory than any other method of Cutter-fastening. Both patterns are illustrated above.

The Screws, made of a fine grade of Alloy Steel, are accurately machined and carefully heat-treated and hardened. They are unusually tough and strong and give the maximum efficiency obtainable from this type of Cutter-fastening.

Right and Left Hand Offset and Straight Shanks in stock at same prices as Cam Pattern of corresponding size.

May we send you a copy of our Machinists' Tools Booklet.

Notes On Grinding
NORTON COMPANY, WORCESTER, MASS.

No. 60A

Cam Grinding

What causes Cams to show softness after grinding

A frequent difficulty met with in cam grinding is a sequel to the effect produced in the use of too hard a wheel, which causes the face of the cam to crack or check. The difficulty is known to the operator as the softening of the cam and is usually charged by him to some defect or error in the machine attachment or method, whereas as a matter of fact in almost every case it is due to carelessness in regulating the work speeds, the depth of cut or the grade of the wheel used.

By the best known methods of testing hardness, either by the Brinell meter or the scleroscope, when the proper speeds and grades of wheels have been used there is no effect of softening that can be detected by such tests. This matter comes back to the same old difficulties in cam grinding, namely, that it is usually the common practice in finishing cams to use too hard a wheel, which in order to act properly causes the operator to take too deep a cut, which generates so much heat that the compound does not dissipate it fast enough and the temper in the cam is drawn slightly, or in the other case when the other defect is noticed the cheeks of the cams are checked or cracked. But when light cuts are taken and soft wheels used these errors are entirely removed.

There is a knack in grinding cams which requires greater skill on the part of the operator than in most grinding operations. It is largely due to the fact that the cam is of an irregular shape and the action of the wheel at different points on the periphery of the cam varies, so that the operator has to use a great deal of care in adjusting other conditions, such as the speed of work, depth of cut, and flow of water to bring about the desired results.

Pneumatic Scraper for Fine Machine Work

No More Tedious Hand Scraping if We Use Such a Scheme as the One Spoken of in This Article—We Hear the Man in the Shop Exclaim, "It's Too Good to Be True."

By J. H. MOORE

IT is a well-known fact that one of the most responsible and delicate operations of the machinist, requiring both skill and perseverance, is that of scraping metal surfaces, usually cast iron, where minute accuracy is required. Under this head naturally we think of valves, valve seats, slides of lathes, planers, etc.

Such operations are usually entrusted to only the best of workmen, and at present in the majority of shops, this is considered a hand operation.

What may tend to change this style of scraping is an air-driven tool which the Anderson Brothers Manufacturing Co., Rockford, Ill., are now building, and which is illustrated by various photos throughout this article.

Such a fixture or tool should prove a valuable acquisition to any machine shop equipment.

The scraping tool in actual use is first shown at Fig. 1. This is carried at the end of a long arm, and the air cylinder and operating parts are located at the opposite end of this arm. To facilitate the manipulation of the tool, this air cylinder and its auxiliary mechanism are carried by a trolley which may easily be run back and forth on the supporting rail in order to enable the scraping tool to reach exactly the desired position on large pieces of work. The operator holds the scraping tool firmly down on to the work with the left hand, and the right hand is used to manipulate a knurled sleeve which actuates a valve in the air cylinder. When this knurled sleeve is pushed forward it allows the air to enter the cylinder and forces the scraping tool forward.

FIG. 1—THE SCRAPING TOOL IN ACTUAL USE.

FIG. 3—VIEW SHOWING TURNTABLE.

As the only effort required of the operator is to hold the tool down to the work, he is relieved of the additional effort of pushing the tool forward, and as a consequence is not so tired at the close of the day as he otherwise would be were the job a hand process.

Fig. 2 illustrates two types of stands, first the stationary type of base, and secondly the portable base, which of course is more often used where one scraping tool is used at various parts of the plant. Fig. 4 later on in the article shows this portable stand in use.

Fig. 3 illustrates a turntable, on which the work can be placed, and by pressing on treadle you can turn the work to whatever position you desire.

We see the actual work being performed at Fig. 4, and the convenience

FIG. 2—THE TWO TYPE OF BASES.

of the apparatus is self-apparent. No doubt before long we will see all up-to-the-minute machine shops do their scraping by some method such as described.

A LARGE HACKSAW

By L. P.

Sixty years ago, and even later, the hack-saw was the most ill-used tool in a workshop. It was soft enough to be sharpened with a saw file, and was very soon blunt. No one would sharpen it after use, so filing it up was preliminary to using it. The teeth had no clearance beyond the rough side produced by the file, and so a deep cut was a laborious business that no one liked. The modern hacksaw is a very different tool and has effected extraordinary economies in the workshop. It is made of a very high quality of steel, having great durability, and, when handled with reasonable care, will do an enormous amount of work before being worn out. Fitted in a sawing machine in which the speed movement and pressure are carefully regulated, it will cut up round and square bars to finished lengths that require no further treatment. In course of time the size of the work it would undertake grew beyond anything at first contemplated, and to-day there is in use at the Royal naval gun factories in England a set of five motor-driven hack-saws that will deal with all hardened bars of gun steel 15 inches in diameter. They are looked after by one unskilled man and a woman. A larger machine has recently been added to the outfit of the same works. It weighs 3½ tons and will cut through a 26 in. square billet of steel with one blade that still remains serviceable. A 3 h.p. motor drives it. The cost of sawing is only one-sixth of the cost of the method previously employed. At the present time there is much competition in hack-saw blades as in files, so that their price remains so moderate that no well-appointed workshop can afford to be without them. It must, however, be noted that the modern hack-saw is not fool-proof; it can be spoiled in less than a minute by any stupid workman who, using it like a file, may rub the teeth off in a few strokes. The user should begin with a slow and steady stroke at a very moderate pressure, using the whole length of the saw until it is properly entered into the metal. The pressure may then be increased to a moderate degree, but it should never be excessive as the saw consists of a row of very small cutting points that are highly tempered and not meant for rough work. Rightly used, the hack-saw will save a great amount of filing and chipping, representing time that is convertible into money.

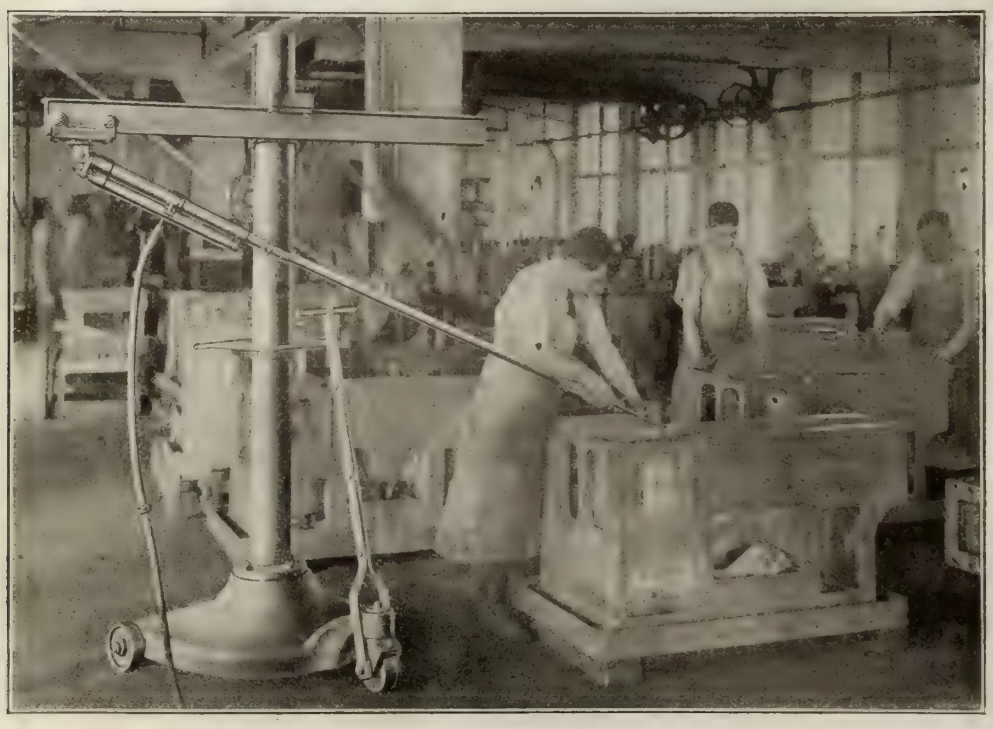

FIG. 4—THE ACTUAL WORK BEING PERFORMED.

HOW TO BLACKEN BOLT HEADS

By John H. Bedell

(Copyright. All rights reserved)

Specially prepared lacquers can be obtained from supply houses for giving metal work for electrical switchboards a dull black finish. If such preparations are not available, dull black paints, which will serve in emergencies, can be obtained in ten cent or larger cans at most hardware stores or paint shops.

The following process has been used successfully for giving bright-finish steel cap bolt heads a dull black finish: First, heat the bolt to a dull red in a blow-torch flame, then dip it in asphaltum paint. Now burn the paint off with a blow-torch and rub it with a cloth while it is still warm. If the bolt is permitted to cool before it is rubbed with a cloth, the resulting finish will be glossy instead of dull.

Improved Process of Case Hardening

AS the result of an investigation into the prevention of flaking and chipping of certain case-hardened articles, such as nickel steel gear wheels used on motor car and aero engines, and straight carbon steel camshafts. Mr. D. Hanson and Mr. J. E. Hurst have devised certain modifications in the case-hardening process, which they described before the Iron and Steel Institute.

After a discussion of the theory of case hardening, the authors said that among the articles in which cracks developed during grinding were various forms of gear wheels made from steel containing about 2.3 of nickel. These had carburized in a mixture of charred leather with 10 per cent. of barium carbonate for 10 hours at a temperature of 900 degrees C., after which the box was withdrawn and cooled in air. For refining and rehardening a subsequent reheating to 800 degrees, followed by oil quenching, was adopted, and after this treatment the mechanical properties of the core and the hardness of the case were perfectly satisfactory. The gears were sent to another firm for grinding, and many of them failed during this operation, through the formation of fine cracks running from the surface into the metal. On cutting sections through the teeth of a number of wheels, and examining them under a microscope, in almost all cases a certain amount of free cementite, arranged in cellular form, was detected at the edges of the teeth. It was not invariably found, but in some cases might have been removed during the grinding process.

Slow Cooling

Experiments were made to elucidate this condition and to determine whether by submitting the steel to a slowly falling temperature during the later stages of the carburization a case would be obtained in which the harmful cementite network was not found. Pieces of the 2½ per cent. nickel steel were heated in contact with the carburizing material for 6½ hours at 900 degrees, at the end of which time there was a high concentration of carbide in the outer portions of the case. The temperature was then gradually reduced to 800 degrees, the refining temperature of the core, which temperature was reached in 4½ hours, and was maintained for a further four hours, the total length of the whole operation being 15 hours. It was found that by this treatment a depth of case was obtained equal to that formerly obtained by 10 hours heating at 900 degrees. These times were arrived at after a few preliminary experiments. The specimen was then cooled in the box, which was removed from the furnace.

Microscopic examination showed that this treatment had been very successful. The outer portions of the case contained in no part more than a slight cementite network, and on quenching the steel from 800 degrees it was found that no cementite was left undissolved, and the structure consisted mainly of a uniformly fine martensite.

In other cases the lowering of the temperature from 90 degrees was slower; in many operations on a works scale the whole period of 8½ hours was taken for this lowering, when the box was withdrawn without further treatment, with results that were quite satisfactory. Annealing for one or two hours at the lower temperature, however, appears to give a case slightly lower in carbon than a treatment in which the box is removed immediately 800 degrees is reached, but in all the cases examined no free cementite was found after the articles had been hardened.

Lower Final Temperature

More recently the authors have carried the reduction of temperature somewhat further. In the above cases the final temperature has been that of the refining operation. In their later experiments, and in routine operations on a large scale, this final temperature has been reduced to a point between the refining temperature of the core and the hardening temperature of the case. In articles made from a 3½ per cent. nickel steel the fallen temperature treatment has been carried out from 900 degrees to 740 degrees in the same time of 8½ hours, and the results have been entirely satisfactory. A case in 3½ per cent. nickel steel obtained by carburizing at 900 degrees for 6½ hours, and from 900 degrees to 740 degrees in 8½ hours, followed by cooling in the box, contained in the outer layers mere traces of a cementite network, and a layer of steel of practically eutectoid composition extended from the surface for a distance of .5 in. into the steel. Further, the transition from case to core was very gradual, and took place over a distance of .03 in. There was no sign of "liquation" at any point, and indeed the authors have failed to detect any signs of this phenomenon in any of the steels which they have examined after submitting them to this treatment.

Practical Results

This modification of the case hardening process has been adopted for some months past in the works of Messrs. D. Napier and Sons (Limited) in all operations on straight carbon and nickel steel parts (except 5 per cent. nickel steel) and has given highly successful results. Many thousands of articles have been treated, and the amount of scrap material has been reduced from at least 25 per cent. to practically nothing. For example, by the old methods of carburizing the scrap in the manufacture of air screw shaft gears from a 2½ per cent nickel steel amounted to 25 per cent. On adopting the 900-800 deg. falling temperature treatment this was reduced to 2½ per cent. On changing to the 900-740 deg. treatment (the steel at the same time being altered to 3½ per cent. nickel), up to the time of writing, out of 75 completed gears, none has been found defective. Experience with other forms of gears has been equally satisfactory. In the manufacture of valve end-pieces from 3½ per cent. nickel steel, out of the first 500 manufactured by the old method of carburizing at 900 deg. at least 25 per cent. were defective. By adopting the 900-740 deg. falling temperature treatment the trouble has disappeared.

With straight carbon steels equally satisfactory results have been obtained. In the manufacture of cam shafts, for example, the only failures which have been experienced since the modifications were introduced are very small in number, and can, in each case, be traced to excessive non-metallic enclosure in the steel. In every case in which grinding cracks have developed a sulphur content of over 0.1 per cent. has been found, and microscopic examination has revealed large quantities of sulphide.

It may be safely said that since the introduction of the modifications of the case-hardening process which have been described troubles from flaking and cracking during and after grinding have become practically unknown, and the very few cases which have occurred can all be connected with material which is otherwise defective.

Carburizing 5 Per Cent. Nickel Steel

With articles made from 5 per cent. nickel steel, trouble from flaking has never been experienced, in spite of the fact that the usual practice has been to carburize at 950 deg., a temperature considerably higher than that used for any of the other steels mentioned in this paper, and at least 150 deg. above its upper critical point. The authors suggest that the explanation is probably to be found in the fact that this steel, when carburized, is air-hardening, and normal slow cooling in the box is sufficient to suppress the carbide separation, or, at any rate, to prevent its separation in a harmful form. They have not, however, investigated this steel.

Description of a New Automatic Threading Tool

In This Article is Described a Very Interesting Tool Fixture Recently Placed on the Market by a Well-Known English Firm—Its Description Is Well Worth the Reading.*

It is often necessary, and still more often desirable, to cut screw threads on a number of pieces of work in the lathe; whether on centers or in chucks. It takes a great deal of time to make the successive cuts and get the exact size. Much of this is non-cutting time; in the reverse travel, advancing the tool, changing to finishing tool or comb, etc. When the screw has to end against a shoulder the trouble is doubled. There has not, hitherto, been a practical fixture or attachment for the lathe to deal with this class of work with any reasonable approach to self-acting efficiency.

A new tool fixture recently placed on the market by Alfred Herbert, Limited, Coventry, has been designed specially for this work, in cast iron, bronze, brass and other soft metals. It is not recommended for steel.

Before describing it we may as well summarize its advantages as compared with the usual method of screw cutting in the lathe.

1. It will cut a complete form thread in one travel of the saddle.

2. The thread is cut by six separate tools, which take the various cuts from roughing to finishing.

3. It will cut to a fixed point or up to a shoulder and finish the last thread.

4. Each tool automatically springs clear of the workpiece at a set point, which may be as close to a shoulder as in the ordinary process.

5. Once set it will automatically repeat the same size of thread on any number of similar pieces until the cutting tools require sharpening. It is not necessary to measure each piece, further than to check occasionally, as in screwing with dies.

These five advantages may be condensed into one statement—that the tool will cut a completely formed thread to required size in a fraction more time than is now taken for one cut; or, allowing for reversing, measuring, etc., it will cut the thread in less than one-tenth of the time.

This, of course, refers to a thread turned in the lathe true with the other turned parts of the workpiece; or with the workpiece as chucked or centered if the other parts are not turned.

The construction will be fairly clear from the illustrations, which show different views of the tool fixtures. In its assembled state it is in two parts: a tool box and an abutment, or stop piece.

The abutment, shown in Fig. 1, fits the Alfred Herbert No. 4 capstan lathe. It could be adapted to most lathes or a special stop made. It must, of course, be firm, clear of the moving parts of the lathe, and be adjustable to a fine degree; but the making presents no special difficulty.

The tool box is fixed on the cross slide of the lathe, and once the correct diameter of screw is attained the slide may be firmly clamped so that no small movement or shake may occur. The usual change wheel setting and lead screw are used to travel the saddle in the usual way, except that a complete thread is formed in one travel.

The chasers. The six tools are varied on their cutting edges so that the first starts cutting on the full round surface and the last chases and finishes the thread. The tools are in correct continuous pitch with each other, so that each precisely takes up the work left by the one in front of it. The tools or chasers are of usual form, but accurately ground on the shanks to slide in their places and with a cross slot near the back end, as shown in Fig. 5.

The recoil. Above each chaser is a bar with a projecting piece, the detent bar, to engage the slot in the chaser and suitably formed to be influenced by springs. A stepped former bar, shown in plain view in Fig. 4, with the box cover and detent bars removed, holds the chasers in cutting position until the set point for the recoil is reached. As shown in Fig. 4, the stepped bar has been pushed along to allow three chasers to recoil and still holds three in cutting position—the first of the second three being near the point of recoil. It will be clear that the stepped bar is stopped by the abutment, while the saddle and tool box move along the cut under the action of the lead screw. Therefore the

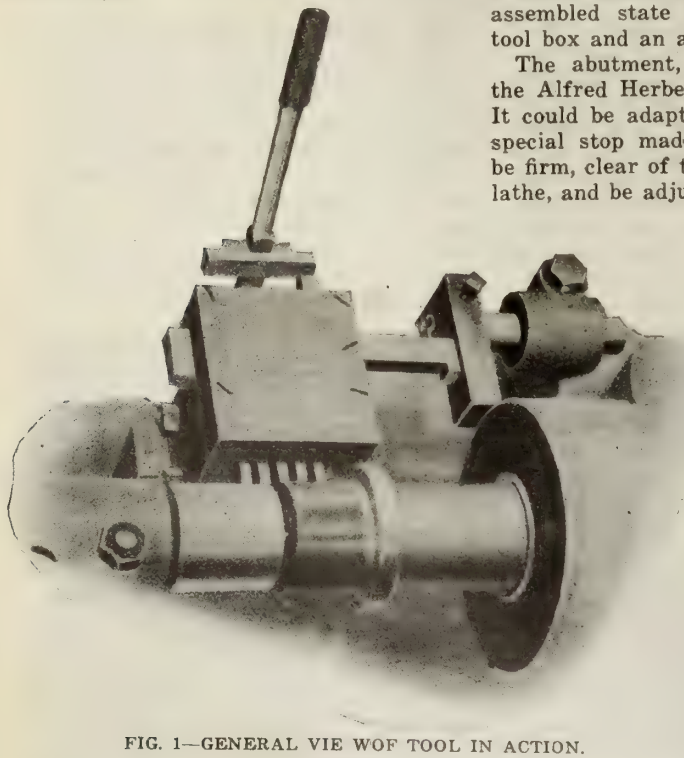

FIG. 1—GENERAL VIE WOF TOOL IN ACTION.

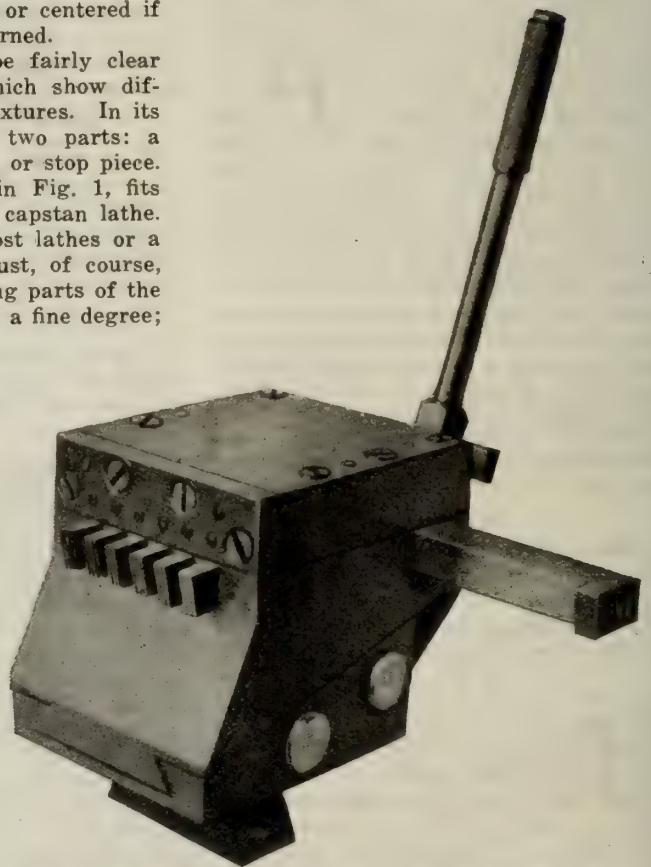

FIG. 2—VIEW OF CUTTING TOOLS AND STEPPED BAR.

*From "Machine Tool Review."

chasers will successively and automatically recoil at the same point.

Re-setting. When a thread is finished the saddle is released from the lead screw and travelled back in the usual way. The chasers are all pushed back simultaneously by the handle and plate bearing on the rear ends of the detent bars, and thereupon the stepped bar springs back to the full extent, as shown in Fig. 2. Another workpiece is then inserted in the lathe and the half-nut put into action as usual.

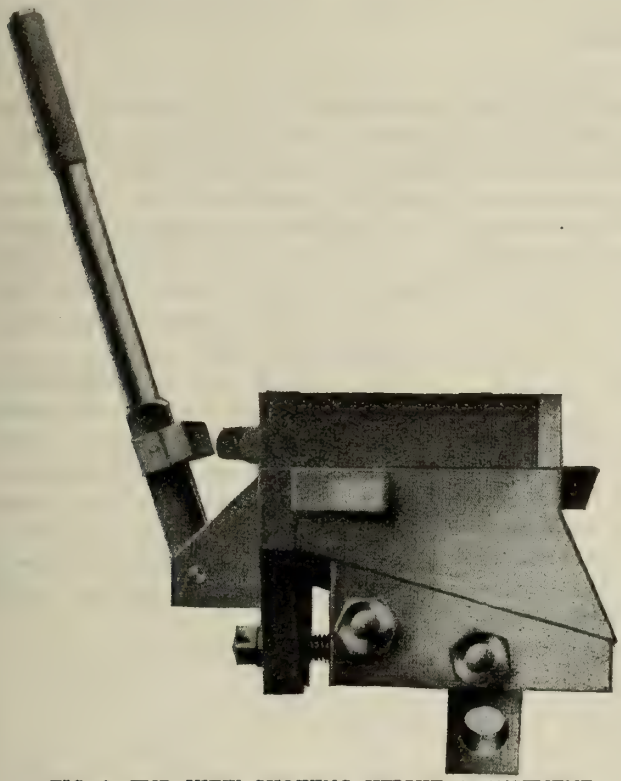

FIG. 3—END VIEW SHOWING HEIGHT ADJUSTMENT.

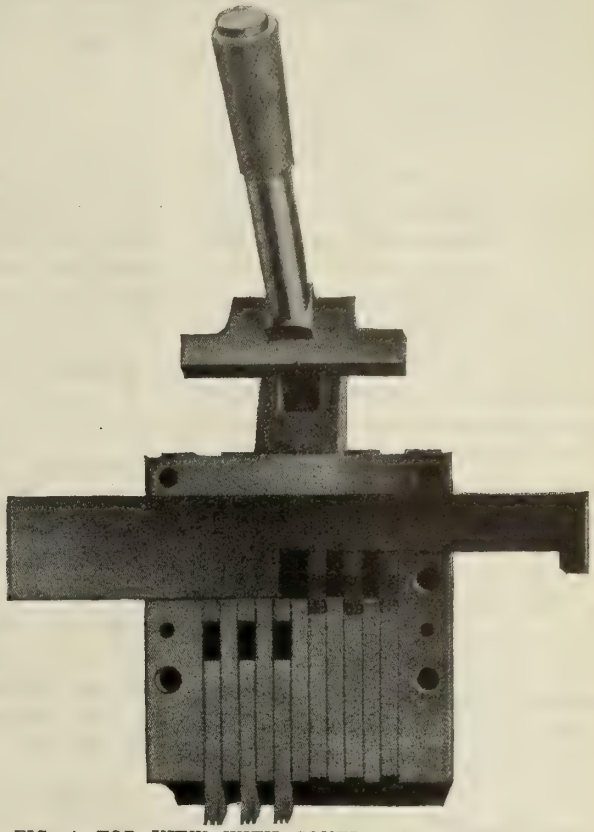

FIG. 4—TOP VIEW WITH COVER AND DETENT BARS REMOVED, SHOWING ACTION OF STEPPED BAR.

Sharpening the tools. The chasers must be ground on a machine, surface grinder or cutter grinder, as the grinding must be equal and accurate. Two methods are available: (1) To take out the chasers and clamp the set accurately together and grind all at once; or (2) to transfer the tool box with the chasers to the grinding machine table and grind all together in position. The chasers are ground flat on the top.

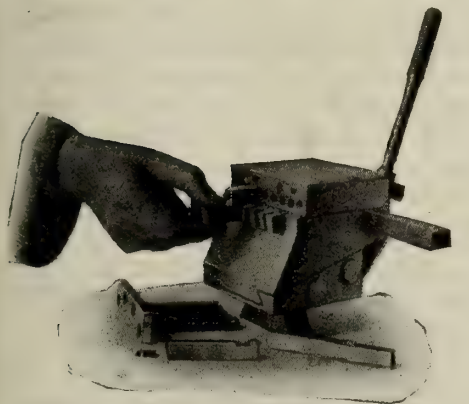

FIG. 5—METHOD OF REMOVING TOOLS.

Setting up. The setting up is reduced to a simple matter. First, fix the tool box and stop to allow the necessary clearances. Then adjust the height of the cutting edges to the diameter and material to be cut. Fig. 3 shows a square head screw for adjusting the height to a nicety and the nuts of the two clamping screws which hold the tool box firmly when adjusted. Figs. 6 and 7 show the main measurements, etc.

Cutting position. The tools being flat on the top, how is the cutting rake obtained, and how varied? Reference to Fig. 6 will make this clear, with a little explanation. The workpiece is shown as a circle, the center of which is below the level of the tool edge. A line drawn from the tool edge to the center of the workpiece would show the top rake as an angle, and this angle can be varied by adjusting the height of the tool edge in relation to the center of the workpiece. A table in the catalogue shows the height of tool edge above the workpiece center equivalent to rakes of 8, 10, 12, 14 and 16 degrees, and shows them for various diameters. For example, a rake of 12 to 14 degrees is suitable for cutting cast iron, and the table shows that a height, as defined, of 7-32 in. to ¼ in. will equal these rake angles for a 2-in. diameter. Similar figures for other diameters and rakes are given; 8 to 10 degree rake is suitable for cutting brass or gun metal, etc. The clearance below the cutting edge is sufficient for the necessary rakes.

The fixture is very compactly made, and sets of tools are stocked to cut Whitworth standard threads from 10 per inch to the finest pitches. The fixture is protected by patent, and is called "The Coventry Automatic Threading Tool." We understand that a small number of the fixtures are ready for delivery and more are in hand.

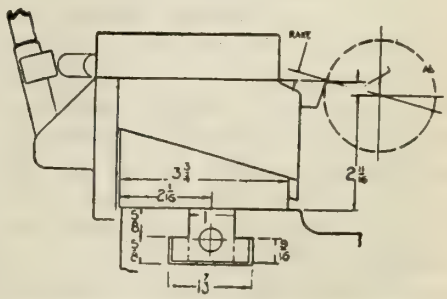

FIG. 7 —FRONT VIEW OF FIG. 6.

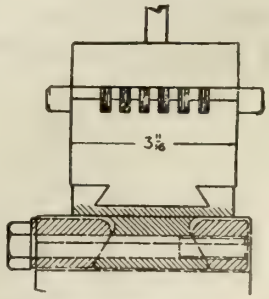

FIG. 6—MEASUREMENT AND METHOD OF ADJUSTING TOP RAKE OF TOOLS.

Leather Prices Still High.—With advances in the different grades of from 1c to 17c, the tendency is for still higher prices. The overseas demand has cleaned out the stocks of leather merchants and tanners, and the price of both shoe and harness leather is affected.

Shop Arithmetic, Mensuration of Solids

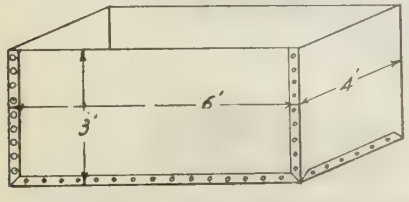
Eighth of a Series in Practical Mathematics for the Mechanic and Those Learning the Machinist Trade—The Present Article Takes Up the Subject Mentioned in the Title

By J. H. RODGERS

IN calculating the area of plain figures, length and breadth are the only two dimensions required, apart from such constants as are universally recognized for the solution of problems of this character. For the measurement of solids (figures that occupy space) three dimensions are necessary, and with these any constants that have been derived for easy solution. The surface of the solid enclosing the space is found by adding together the areas of the several sides. The surface of a cube would be equal to six times the area of one of the sides. The volume would be the area of one of the sides multiplied by the thickness.

The unit of measurement is the cubic inch, the cubic foot, or the cubic yard, the latter being used chiefly by civil engineers in excavation calculations. Some of the more common solids are shown in the chart herewith together with the formulae required for finding the value of the different elements.

To illustrate the practical application of the measurement of solids, we will give a few concrete examples. Suppose it is required to construct a tank that will contain 540 gallons of oil, and the floor space allowable is 6 by 4 feet, what will be the height of the tank? The volume of the U. S. gallon is equal to 231 cubic inches, and the first detail required is to find the cubic contents equal to 540 gallons. This is found by multiplying the volume of one gallon by the number of gallons; thus:

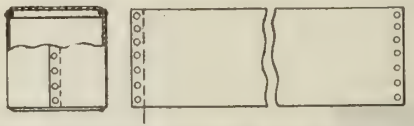


231 x 540 = 124740 cu. in. or
124740 ÷ 1728 = 72.18 cu. ft.

As the area of the base is 6 x 4 feet, or 24 sq. ft., the height would be:

72.18 ÷ 24 = 3.008 ft. or 3 ft. .11 in.

Suppose we have a cylindrical tank to make that will contain 1,000 gallons, and we are restricted to a height of 6 feet, what will be the diameter, and also the dimensions of the flat sheet required to form the cylindrical portion, allowing for a lap seam of 2 inches? The volume corresponding to 1,000 gallons would be:



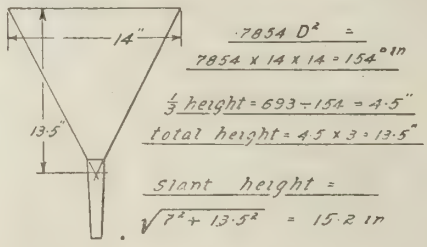
231 x 1000 = 231000 cu in or
231000 ÷ 1728 = 133.68 cu ft.

As the height is to be 6 feet (no allowance being made for the thickness of metal) the cross sectional area will be: 133.68 ÷ 6 = 22.28 sq. ft. The diameter can then be found by dividing this value by .7854, and extracting the sq. root of the quotient.

$$\sqrt{\frac{22.28}{.7854}} = \sqrt{28.342} = 5.32 \text{ ft}$$

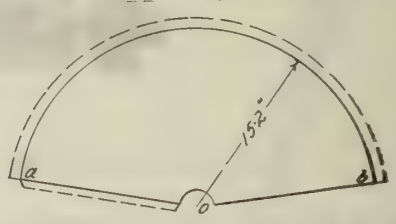
The length of plate would equal the circumference of the tank, plus the width of the lap seam, or—(64 x 3.1416) + 2 equals 202 inches.

A cone-shaped funnel is required, its maximum capacity to be 3 gallons, and the large diameter to be 14 inches; what will be the central height of the cone, neglecting the diameter of the small end? The volume of three gallons would be 231 x 3 equals 693 cu. in. The volume of a cone equals the area of the base times one-third the altitude, or axial height. Therefore, one-third the height will equal the volume divided by the area of the base. In this case the area of the base would be:



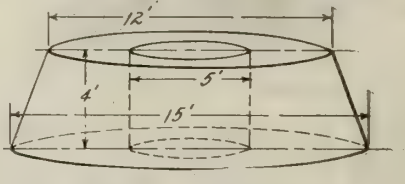
These dimensions, however, are of little value unless we know how to lay out, on a flat surface, a shape that, when formed up, will give us the cone desired. First, find the slant height by the principle of the solution of right angles. The slant height is equal to the hypotenuse of a right triangle with sides of 7 and 13½ inches respectively, these dimensions representing the radius of the base and the perpendicular height. The slant height will then equal the sq. root of the sum of the squares of these two lengths.

Now, with a pair of compasses or trammels, describe a portion of a circle having a radius of 15.2 inches. Then from the point A lay off a distance A-B, equal to the circumference of a 14 inch circle. Connect B with O and the enclosed space will represent the shape of the piece required. In addition to this



it will be necessary to add sufficient to one edge to make the seam, and also on the outer circumference for wiring or stiffening purposes. A small portion at the apex will require to be cut away to provide for the lower opening. These modifications are shown in dotted lines.

A concrete foundation, in the form of a frustum of a cone, and with a hole in the centre 5 feet in diameter, is required for a machine support. The lower diameter is 15 feet, and the top diameter is 12 feet, with a height of 4 feet; what would be the number of cubic yards of material in the foundation? The volume of a frustum of a cone is found by adding the area of the upper and lower bases and the square root of the product of the two areas, and multiplying the sum by one-third the altitude. The area of the bases would be:



15² x .7854 = 176.7 Sq. ft.
12² x .7854 = 113.1 Sq. ft.

Placing the above rule in the form of a formula, and representing the base areas by A and a, and the altitude by H, we have:

$\frac{1}{3}H\left(A+a+\sqrt{A\times a}\right) = \frac{1}{3}H\left(176.7+113.1+141.36\right)$

$\frac{1}{3}\times 4\times 431.16 = 574.88$ cu. in.

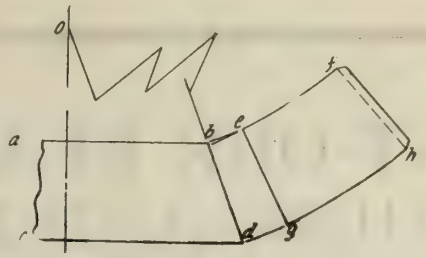
From this we deduct the volume of the centre hole, which would be:

$5^2\times .7854\times 4 = 78.54$ cu. ft.

& $574.88 - 78.54 = 496.34$ cu. ft.

If a sheet steel protecting casing was placed on the outer convex surface, what would be the shape of each portion if the frustum was composed of 8 pieces, with 2 inch laps?

The method of developing the flat sheet is shown in the above sketch, where the foundation of casing is shown



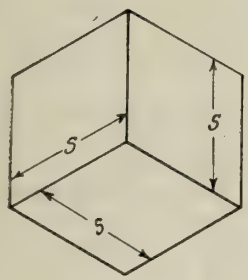
in elevation, with the axial line and the slant surface, produced to meet at the point O. With O as a centre and O-B and O-D as radii, describe the areas B-F and D-H. On the outer arc lay off a distance equal to ⅛ the circumference of the lower base circle, and from the ends draw the radii G-E-O and H-F-O. The portion E-F-G-H will be the shape required. Add the required lap for the seam.

Suppose we wish to make a sphere of cast iron that will weigh 80 lbs., what must be the diameter? Cast iron weighing .26 lbs. per cu. in. The cubic inches in the ball would be the total weight divided by the unit weight, or 80 ÷ .26 equals 307.7 cu. in. The volume of the sphere equals the cube of the diameter multiplied by .5236. Therefore the diameter will equal the cube root of the quotient of the volume divided by the constant .5236, or

$\sqrt[3]{\frac{V}{.5236}} = \sqrt[3]{\frac{307.7}{.5236}} = \sqrt[3]{587.66} = 8.37''$ (11)

The convex surface of a sphere equals 3.1416 D^2. The convex area of the above ball would be 3.1416 D^2 equals 3.1416 x 8.37^2 equals 220.1 sq. in.

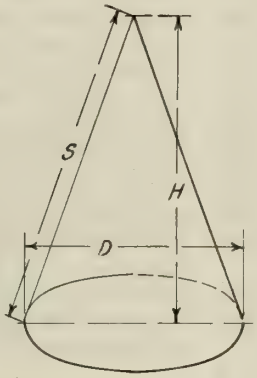
Data for Chart



CUBE

The exposed surface of a cube equals six times the area of one of the sides, or S x S x 6.

The volume equals the area of one of the sides multiplied by the thickness, or S x S x S.



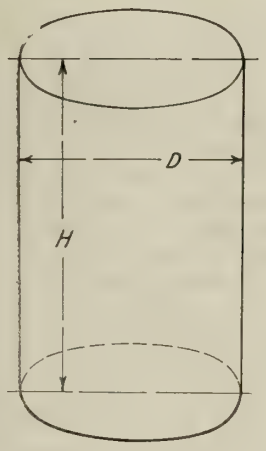
CONE

The convex area of a cone equals the circumference of the base multiplied by one-half the slant height, or A equals 3.1416 D x .5 S.

The volume equals the area of the base multiplied by one-third the altitude, or V = A x 1/3 H.

The slant height equals the square root of the sum of the squares of the base radius and the altitude, or

$S = \sqrt{\left(\frac{D}{2}\right)^2 + H^2}$.



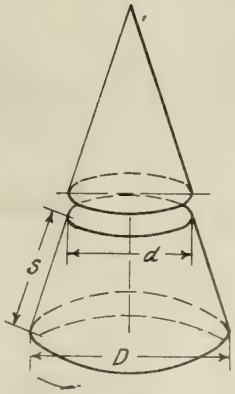
CYLINDER

The convex surface area equals the circumference multiplied by the height, or 3.1416 D H.

Area of one side equals .7854 D^2.

Volume equals .7854 D^2 H.

Contents in U. S. gallons equals the volume in cubic inches divided by the constant 231.



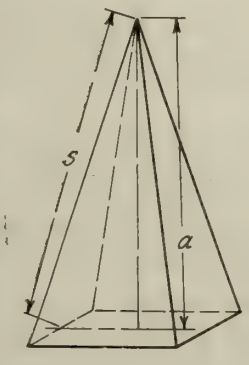
CONE FRUSTUM

The convex surface of the frustum of a cone equals the product of the slant height and one-half the sum of the perimeters of the two bases, or A equals S x .5 (3.1416 D 3.1416 d).

The volume equals the sum of the areas of the upper and lower bases and the square root of the product of the two base areas, multiplied by one-third the altitude, or

$V = \frac{3.1416}{4}(D^2 + D\,d + d^2) \times \frac{1}{3h}$

The slant height equals the square root of the sum of the squares of the altitude and the difference between the radii of the bases, or S equals $\sqrt{H^2 + (R-r)^2}$.



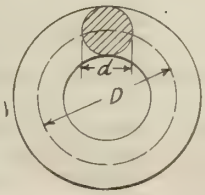
PYRAMID

The convex area of a right pyramid equals the perimeter of the base multiplied by one-half the slant height, or A equals perimeter x S.

The volume of a right pyramid equals the area of the base multiplied by one-third the altitude, or V equals A x 1/3a.

SPHERE

Convex surface equals 3.1416 D^2. Volume equals .5236 D^3.



CIRCULAR RING

Convex area equals the circumference of the cross section multiplied by the length of the central line of the ring, or A equals 3.1416 d x 3.1416 D.

The volume equals the area of the cross section multiplied by the length of the central line of the ring, or V. equals .7854 d^2 x 3.1416 D.

WHAT OUR READERS THINK AND DO

Centering Chuck Work Discussion Re-opened

Readers of Our Magazine Are All Het Up Apparently Over the Subject of the Art of Proper Centering. Here Are Three More Suggestions, With Which We Will Close This Discussion

Compiled by J. H. MOORE

ANYBODY who remarks that CANADIAN MACHINERY is not well read may take a back seat at once, for we have proof positive every day as to the wide field which it covers. The interest taken in the article by J. J. McIntyre in our May 8th issue, regarding his method of centering, started another proof ball rolling, for since his article appeared all sorts of schemes, replies, and criticisms have rolled in from various readers.

In our May 29th issue we reviewed the article and published two other suggestions. But still the ideas roll in.

To close this discussion, which, of course, must close some time, we publish three more schemes and call it quits. Be it understood that we have played a strictly neutral role in this matter and continue to do so. These three articles are published to illustrate the variance of opinions on the subject.

We will first see what a Brantford reader has to say:

MY IDEA OF QUICK CENTERING

By S. G. MACKLIN

Referring to page 554, your May 29th issue of CANADIAN MACHINERY, I would like to know why these gentlemen go to this trouble to centre work? Or what are the particular circumstances that make it necessary in this line of work?

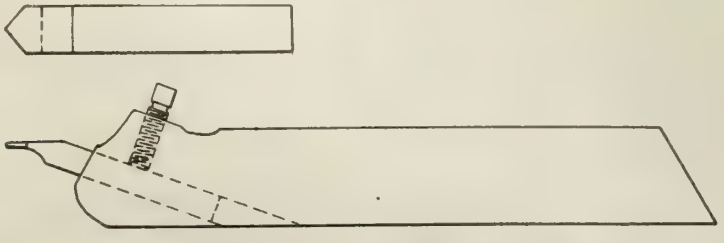


FIG. 1—S. G. MACKLIN'S SUGGESTION.

In our line the only circumstance that would justify this method of centering work would be when one diameter is the diameter of the stock,, in which case we would proceed as follows:

We would chuck the work, and face the end, using an Armstrong tool holder, then without changing the tool holder, but removing the tool bit, we would insert a tool bit ground as a centering tool, as shown at Fig. 1.

The face, A, is ground parallel with the holder, as shown and ground like a flat drill 118 degrees included angle. The advantages of the incline of the tool holder is self apparent for it supplies a ready means of quickly bringing the tool to the centre.

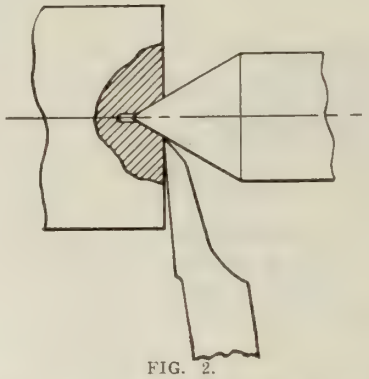

FIG. 2.

Having now a centre in the work, we take the drill chuck with its No. 3 Morse taper unglorified, and using the tail centre in the chuck's centre, make the required centre in the work without giving the matter any thought at all (being one of the things in a day's work). It is taken for granted (just as the blacksmith puts his tongs on a piece of work and places it in the fire without any thought that the fire will make it hot) so to continue.

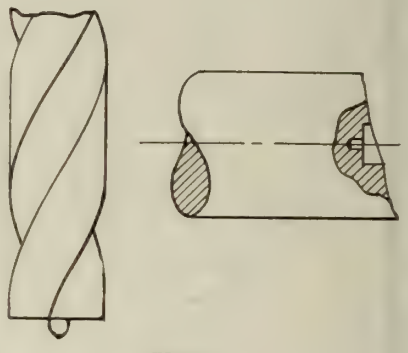

FIG. 3.

Now let the writer issue a little tip for the man that always leaves a tit on his faced ends. Is he not aware that by letting the centre back a little the tool can be made to pull the work over and cut from the edge of the centre, and tightening up as soon as the tool is past the centre, being careful to note that the tool is reasonably near the shape required for such an operation, similar to shown at Fig. 2?

Another scheme is as follows: Make two stabs at the work by grinding a twist drill, with a little pilot on it and square faces, at Fig. 3, before putting the 60 degree centre in the end of the work, face down, as far as it may be necessary to straighten the end of the piece.

To refer once more to where we started we admit that in cases of necessity this method of centering work is advisable, but for a general practice, making special tools to centre work looks like a long way round for a short way home.

Now that Mr. Macklin has had his views aired, let us hear from another reader from Amherst, Nova Scotia:

REGARDING CHUCK DISCUSSION

By T. WILLIAMS

Regarding quick method of centering chuck work. CANADIAN MACHINERY is read by quite a large number of tool makers, machinists and apprentices that they may become more efficient; as well as executives, who want to keep abreast of the times.

It is a good idea to be able to exchange views and know how things are done in other shops as new ideas spring up from time to time. It is also instructive reading, how some difficult repair has been accomplished in a thorough and workmanlike manner. With your assistance, Mr. Editor, I would like to see CANADIAN MACHINERY maintain this standard.

I know you are not responsible for other people's views.

In CANADIAN MACHINERY of May 29th, page 554, referring to Fig. 1, I fail to see how Mr. S. Simpson can claim an improvement on Mr. J. J. McIntyre's "Chuck Under Discussion," illustrated on the same page.

Everyone who uses combination drill and countersinks know, and sometimes to their sorrow, how easily they are broken.

Referring to Fig. 1 to use it, it is first necessary to spot drill the piece of work or locate the centre; otherwise reverse the tool-holder or replace with a suitable piece of stock in the tool post. Place the drill chuck complete, as shown in Fig. 1. in position for drilling, and bring up the back centre; now the tail of the lathe dog most likely will bear on the compound rest to prevent turning; if the piece of work to be centered has not already been spot drilled, the piece of stock in the tool post, as before mentioned, must be brought against the drill to bring it in the centre. With the drill chuck placed in position the drill has a greater strain on it by virtue of the extra weight than it would have by using Mr. J. J. MacIntyre's "Chuck Under Discussion" idea, which is self-centering, and holding the same by the fingers, as shown in the photograph.

And the fact of it being self centering it is unnecessary to use a piece of stock in the tool post to force the drill in the centre.

He goes on to say such a scheme has its disadvantages, for, first, it is difficult to tighten the chuck with the hands. etc. It should be unnecessary to call Mr. S. Simpson's attention to the fact that those chucks as illustrated are supplied with a pinion wrench to be used for tightening, and by so doing it is not necessary to use the vice under ordinary circumstances.

Last, but not least, we come to the views of a Halifax reader.

CHUCK DISCUSSION

By G. R. FOWLER

I noticed the articles in CANADIAN MACHINERY in connection with centering chuck, and I think I can offer a better suggestion than any I have read so far. Make a collet, as shown at Fig. 4, to fit the tapered portion of tail stock of lathe, and place a ¼ in. pin in the same, which in turn will fit into slot across the end of tail stock barrel, preventing the same from revolving while the strain of drill is on.

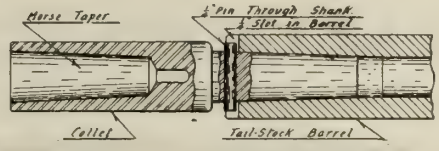

FIG. 4—G. R. FOWLERS' IDEA.

The end of collet is tapered to fit chuck or drill, and made with the usual slot going through in order to receive key for removing chuck or drill.

By adopting this method everything is central, and by using combination drill and countersink, it will not be necessary to spot work with the tool at all.

I made one of these collets to fit all of our lathes, and find them very handy and quick, not only for centering, but for drilling. By slotting end of bush in headstock to receive pins through male part of collet it can also be used for drilling cast iron pipe flanges, etc., which may be too long to go under the drill press.

By using tailstock as a means to feed the work up to drill, and placing drill chuck in collet, when the live centre has been found very useful for turning small ——— which would be found difficult to hold in a large chuck.

There are several other advantages that a practical man will readily see, so hope you see fit to print this in regards to the discussion.

Here endeth the discussion so far as we are concerned. Our space in this section is limited, so we must get into other fields. Is there not some jig or fixture of any kind that has proved a real saving proposition? If there is we want to have the privilege of looking your sketch and article over to see if we can use the same in our columns. We pay for such articles, so get moving and make some easy money on the side. Did you note that Brantford, Amherst, Nova Scotia; and Halifax, were the parts where these letters came; and our distribution centre is Toronto? Think it over.

Tunnel for Windsor.—There is a good deal of talk going on here on the subject of a tunnel between Windsor and Detroit under the Detroit River. The idea originated with Mayor Winter, and a Detroit contractor has already called on the Mayor and made tentative proposals for the construction. Estimates of the work are that it could be done for $6,000,000, exclusive of approaches. The plan would be for each city to build the approach to the tunnel on its own side, and the cost of the tunnel itself to be borne by a stock company. A toll sufficient to pay a reasonable return on the investment could be charged and arrangements made for the two cities to take the subway over after a reasonable time.

REGARDING STAMP CLEANER ARTICLE

WE have had brought to our attention a matter of a rather serious nature regarding an article we published recently in our columns.

This article was entitled: "Cleaning Off the Title Stamps." In the same was mentioned that the contents of a fire extinguisher made an ideal stamp cleaner.

On the surface, this seems like a good joke on the extinguisher, but listen to what one of our readers has to say.

"Referring to a recent article in your paper, with reference to extracting carbon tetra chloride from fire extinguishers. It is admitted that carbon tetra chloride is a well-known, but somewhat expensive cleaning agent or solvent and is largely used in the arts for this purpose.

"In view of the strong efforts now being made by various parties, including some of the Canadian trade and technical papers, in order to endeavor to prevent some of the terrific waste that is now taking place from fires, it is felt that this article is a little out of place.

"One of the difficulties met with around factories, stores, etc., in connection with the maintenance of chemical extinguishers is to prevent tampering. Tampering being a great difficulty, especially with extinguishers of the one quart carbon-tetra chloride type, of which the "Pyrene" is a sample.

"These extinguishers, when new, or issued from the makers, are sealed with a fine wire, and several firms make it a practice to periodically send a man around to reseal these extinguisher handles from time to time.

"You will appreciate that if the extinguishing agent is removed from an extinguisher by all or sundry who require the fluid for cleansing purposes that when the emergency arises the apparatus will fail.

"I would suggest that a good way of endeavoring to remove the harm done would be for you to insert an article somewhat as follows:

"It must be distinctly understood that to tamper with fire extinguishers under any conditions is absolutely prohibited, the reason being obvious.

"I trust you will excuse my calling your attention to this apparently trivial matter, which, however, is of quite a serious nature."

We thank our correspondent for this reminder, and heartily endorse his statements, that, much as we wish an ideal cleaner, we do not wish to perhaps endanger life as a result of thoughtlessness.

Construction Men for France. — The Canadian Des Moines Co., of Chatham, are asking for sixty steel erectors and riveters to proceed to France for nine months' work. The place mentioned is Bordeaux, and the work consists of erecting observation towers. Board and transportation will be paid each way and pay commence at the start of the trip. Wages offered are 70c per hour and a 50-hour week.

DEVELOPMENTS IN SHOP EQUIPMENT

BEAMEN & SMITH CONTINUOUS MILLING MACHINE

THIS is a heavy, rigid manufacturing machine, designed for the rapid and economic handling of milling work.

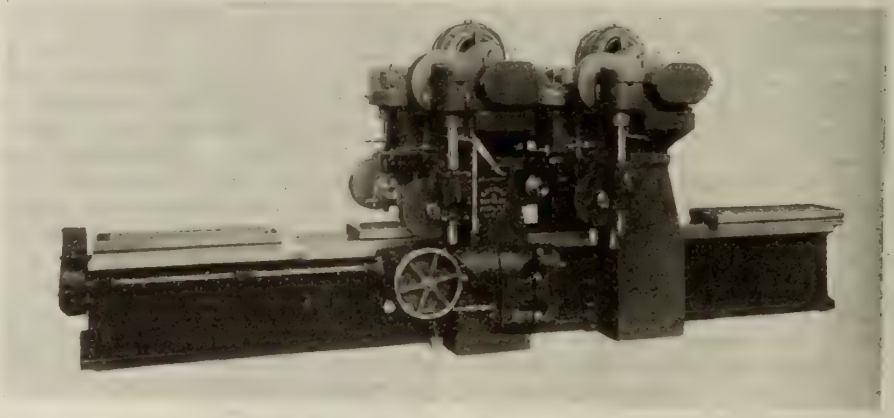
It consists of a substantial bed to which uprights are attached. A pair of these uprights supports the horizontal spindle heads and the cross rail which carries the vertical spindle heads. Each pair of uprights with its bank of spindles is one milling unit. As many spindles may be mounted on this unit as necessary, and as many units may be attached to the bed as required to do the work. Usually two are sufficient. The feed driving mechanism is carried on one unit only.

Removable tables, carrying the work, feed continuously along the bed, (taking a fast motion when the cutters are idle and a slow motion when the cutters are working.) These tables, after having passed all the cutters, are lifted from the bed and the finished work removed. Another table with the work already attached is placed on the front end of the machine and the process repeated. As many tables are furnished as are necessary, usually four, to maintain continuous milling. Such machines will handle, on one trip of each table by the cutters, any milling required on two sides and the top of any piece, within its capacity. By loading the tables to capacity a large amount of work can be handled in a very short time.

A single glance at the cut shows a sturdy machine with two units and three removable tables. A closer inspection shows the wide variety of work which can be handled and the high production rate which can be maintained. The machine, once started, need not be stopped until it is desired to change the cutters or to accommodate new work.

The bed ways on which the tables travel are flat, with slight tapers on the inside edges to accommodate corresponding tapers on the bottom of the tables.

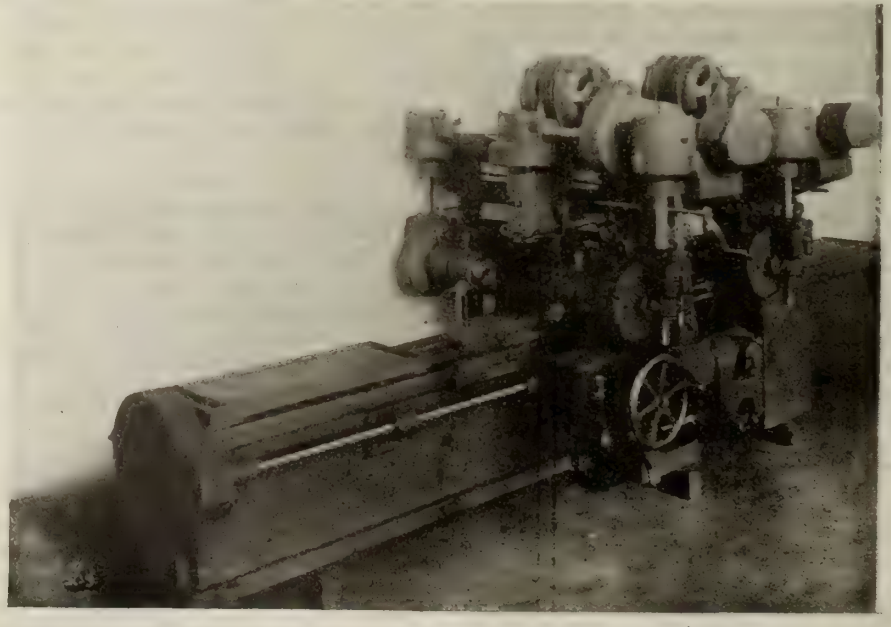
These centre the tables without wedging them, and allow them to be put on and taken off rapidly. The tables hold themselves in position by gravity while travelling, except when passing by the cutters. Here they pass under gibs, fastened to the bed, which hold them against all vertical movement while the cuts are being taken. A feature of the table design is the narrow guide which is tapered as above mentioned. This makes for the maintenance of a greater degree of accuracy through a longer period than the common wide guide. There is a taper gib to take up wear.



GENERAL VIEW OF THE MACHINE.

A feed shaft, which runs the entire length of the bed and is driven on the front end, carries a series of worms spaced at such intervals that the travelling tables are picked up by one worm before they have completely left the other. These worms engage in a rack on the bottoms of the tables. The spacing of the worms makes it impossible to set a table in the wrong position on the bed, and no matter where set it will pick up and travel instantly. The tables have feed in one direction, and fast motion controlled by hand, forward and reverse.

There are four changes of feed through gearing, providing a variation of from approximately 3 in. to 8 in. a minute, with a fast motion of about 12 ft. a minute when the cutters are idle. Two changes of feed are possible through change gears at the end of the gear box and two more are possible through a feed gear shifting lever. The feed and fast motion are controlled by one lever which makes it impossible to get



CLOSE UP VIEW OF THE MACHINE.

both at the same time. The object of the feed gear shifting level is to slow down the feed as occasion may require. The feed mechanism is driven by means of a vertical shaft connected through bevel and reducing gears to the main drive shaft.

Each unit is motor driven. The motor and driving mechanism is carried on the cross rail which is supported by the uprights.

The drive shaft is geared direct to the motor and, through reducing gears, drives the vertical and horizontal spindles. Through change gears which are easily accessible the spindles can be given various speeds.

The heads are of rigid construction, cast in one piece and are adjustable along the ways by means of hand operated screws. Wear is taken up by taper gibs. All have the feature of narrow guide for maintaining accuracy of alignment. When a cutter is located the head is clamped firmly in position.

Spindles are furnished in three standard sizes, the largest diameter in the front bearings being 3⅝ in., 4⅝ in. and 5⅝ in. All sizes can be incorporated on one machine and in heads located as occasion requires. They have hand adjustment in and out of the heads by pinion and rack. The pinion is held in the head and the rack is on the spindle quill. The quill is held in final position by being clamped.

Careful attention is paid to the oiling of all running parts.

The machine is controlled at the unit which carries the feed gears.

Quality of finished work, great rapidity of production and ease of operation are the characteristics of this type of machine.

The machines are patented at home and abroad.

Big Factory for Quebec.—It is understood that the Marceau Oil Cloth Company will shortly erect a factory in the city of Quebec. The buildings are estimated to cost half a million.

WHAT IS KINITE?

ONE of the recent developments in steels for cutting tools is a patented alloy known as "Kinite," which is especially adapted for making cutters, dies, taps and other tools with multiple cutting edges. It is said that the many kinds of tools required hardening after finishing and which must retain their original shape and dimensions after hardening can be made to last longer and take less labor in finishing when made of "Kinite." Tools of this class are:—blanking, stamping, forming, perforating, drawing and threading dies, and plug surface and snap gauges.

"Kinite" is cast in specially prepared moulds and has the appearance of a good smooth forging. A peculiar property is that it does not elongate under tensile strain or decrease in cross-sectional area. It retains the shape and size that is desired until the breaking point is reached. Castings made from it are free from the defects and blow-holes usually found in a casting. Unlike all other high-speed steels, it contains no tungsten. It will harden better than many forged products, and when hard is very uniform and close-grained, being one of the densest products of the steel family. "Kinite" hardens in oil or air, at a comparatively low temperature, and anneals at about the same temperature. It is high in heat-resisting qualities and does not scale in the fire, which makes it an ideal material for making cutting tools that have comparatively thin cutting edges. It is also valuable for making machine parts that must resist heat and wear, and which are subject to great abrasive action while in service.

"Kinite" castings do not change their form during the hardening process, hence it is possible to make the casting so near the desired shape and size of the finished tool or die that very little machining or labor is necessary to complete it. This fact also makes it possible to produce large dies in one single piece instead of many small pieces where ordinary die steels are used. In the latter case the pieces must be lapped or ground together after they have been hardened to allow for the shrinkage and change in form when hardening.

"Kinite," on the other hand, has the unusual characteristic of not changing shape or size during hardening, which saves from 20 to 40 per cent. of the labor necessary to finish dies after they are cast. Further, the purchaser saves considerable metal as no more is used than is actually required for the die (regardless of the shape) plus the small amount to be taken from the cutting edges when finishing. The die being cast to practically the finished size a large amount of stock is saved which ordinarily would be wasted. This saving alone in intricate dies, is no mean percentage of the cost of the die.

Another saving is effected in the labor of finishing such types because all the machining can be done while the metal is soft or in its annealed state. Practically no allowances are necessary for changes in hardening.

A certain stove company in Cleveland, Ohio, is using a "Kinite" punch and die to blank out stove legs from 3-16 in. black unannealed steel. They have averaged over 200,000 pieces per grind, and the die appears to be good for at least another season.

Some idea of the kind of dies that are

The Craze For Factories

THERE are municipalities in Canada that are willing to give the shirt off their back in order to secure industries.

This is not a new disease, but it seems to be like the measles in that there is no telling when it is going to break out in a fresh place.

For a number of years the cry of the municipalities has been, "We must have industries." They have in many cases lost sight entirely of the fact that industries go where conditions are favorable for their development. They fail to recognize the history that has been written all over this country of the fool industry seeker.

There are taxpayers in scores of Canadian villages, towns and cities who are even yet putting up their good money for some idiotic scheme that was foisted on the place years ago, and the only memory they have now is the taxes they pay for their foolishness. It is not correct in many cases to say that these concerns were "hoisted" on the municipality. Too often the municipality was out looking for the proposition. It was a happy time for the promoter who had a real lemon in his pocket. It was not hard for him to find places that would listen to him. He would give employment to one hundred people, he would do this, that and the other thing. Well, if he failed? Municipality had the building or the plant, if there happened to be a plant. They might have an asset and they might not. They certainly had a liability in the money or loan they had made.

But this thing still lives. Only a few days ago a Canadian city had a letter from an American concern. This firm happens to be all right. It has been planning to come to Canada for a branch business to handle export trade. It is coming no matter if the municipalities make concessions or not. If they have to pay their own way they will do it. That firm right now has four wonderfully favorable propositions before it. They are being offered for nothing what they were prepared to pay for.

Here is another and perhaps a more concrete case, because we are able to publish some of the correspondence. In this instance a Canadian city, quite an industrial place, wrote to an American plant, intimating that they had heard they were going to open a business in Canada, and on the strength of that taking the opportunity of pointing out the advantages of this particular Canadian centre.

It was only a few days after that the city received the following letter from the U.S. firm:

"Replying to your letter of the 14th ult., will say, that we now have before us a Canadian proposition, in which this particular city has offered us ten acres of land on a railroad siding and have agreed to build on this land a one-story fireproof factory to contain 30,000 square feet, and turn same over to us, free of charge, and give us water and taxes free for ten years. The Hydraulic Power Co. have agreed to give us electric power at ½c per K.W. hour. In return we are to start operations with at least 100 men and to agree, in case we discontinue during the first ten years, to return the property to the city.

"If you have any better proposition to offer, we would be pleased to receive it, and give it due consideration."

Now there may be some few details that were lacking in the offer that was made to the company. They might have been offered free hay and oats for the first six months, free street car rides for the employees and a twenty per cent. discount on their grocery bill at the corner store.

But after looking over what that Ontario town is prepared to do, one might well be prepared to lean back and say, "If you know of a better 'ole, go to it."

Must Get Started Now

THE more deeply one goes into conditions that have to do with the business of this country, the more apparent it is that fundamentally things are sound.

We are emerging from a period that has been enough to put all kinds of business in the hands of the bailiff. It would seem that every influence in the land has set its hand to creating trouble of one sort and another. There has been an absence of influences and conditions that would usually be looked for when trade was booming.

It is necessary that we should not experiment too long along these lines. It may be the height of folly to try and see how long we can do a fairly good business when conditions are not favorable.

This country has got to get to work. There has been a tremendous amount of labor and engineering power gone to waste in strikes and in fighting them.

These conditions are not the ones that keep business sound. Business probably has kept sound in spite of them rather than with their assistance.

Get to work before there is a crack and a sag. Don't let this period of tinkering be too long drawn out or we may find it hard to stop the thing and put the peg in just at the right place.

THE wisdom of bringing the ex-Kaiser to trial in London is open to question. The war is over, conditions have been dictated by the Allies and Germany has signed. Anything done now would be in the nature of a post-climax. It would give the Kaiser a chance to pose as a martyr, a thing that should be studiously avoided.

* * *

THERE is greater ingot capacity in United States than there is capacity to turn out the finished product. During the war the call was for ingots for forging into shell steel. It is hardly likely that it would be practicable or possible to secure full capacity for the furnaces under these conditions.

* * *

SOME wise men have it all figured out that people should produce more and save more. With the first suggestion no person is going to find fault, but with the latter there is good reason to start an argument. Will some of the wiseacres please go into detail and show how anything can be saved while everything necessary to existence camps on a peak-load basis?

We're All Friends---and We All Profit

By W. H. KELLER

President, Keller Pneumatic Tool Company

TOM CHAPLEY was stumped by a piece of work on the heavy milling machine that he runs. The foreman was busy with some other rush work, so Tom appealed to me to help him adjust his machine. While we worked it out together my shirt lost its dignity.

Meanwhile a business acquaintance dropped in. Someone told him to go right out into the shop. He appeared, greatly surprised; I was oily and disheveled.

"How do you manage to preserve any working discipline when you are so free-and-easy?" my friend inquired. "If I helped out one of my men, he would lose no time in passing the word that it was time to 'jump the old man' for more money."

My friend was right. His men would "jump" him. The difference, as I happen to know, is that my friend commands, while I guide. His office is his office; my office is everyone's office.

We made some big changes when we moved our plant to Grand Haven, Michigan, in September, 1915. Many of the "old timers" came along with us; but we enlarged and eventually took on so many new people that it amounted to a brand-new outfit. We have no moth-eaten traditions to observe; no false ideas of the employer's dignity. We got off on the right foot—on a really friendly basis. There we have stayed ever since.

"Here's how I reasoned out my plan for working with others. I set down the three main points for my attention:

1. The right personal contact.
2. An effective general organization policy.
3. Welfare work that counted for, not against, the company.

The right personal contact between workers and employer is mighty difficult to get. The mere physical task of getting out among the men is easy. But that may be far from real "personal contact."

It depends largely on how much real sympathy the employer has with his workers. Some employers—thrice blessed—are apparently born with this fellow sympathy. Most employers have it to acquire. The employer who cannot acquire it must usually hire some man with understanding and sympathy to represent him to his workers. Workers instinctively recognize real friendship, and as instinctively reject sham. Sham friendship leaves the worker cold; it helps instead of hindering professional labor agitators.

The incident I have related shows my attitude toward the shop boys. It's the same in the office. For example, our business keeps everyone in the drafting room pushing; there is no apparent end to the number of plans and designs we have to turn out, usually in a hurry. It is not uncommon for one or another of the draftsmen to come in and ask me about some point in the work, just as the machine operator asked me about the adjustment.

I have never gained the impression that the boys in either shop or office think it strange that I am around them so much. They don't pay any special attention to me; and they never put on the false hustle you see in some plants when the boss happens to make an inspection.

Personal contact with our workers doesn't end when the closing whistle blows. I don't want it to.

We have athletics, encouraged by the company. I play basketball and indoor baseball two or three nights a week in winter, or bowl. Incidentally, the exercise helps keep me in the best kind of physical trim.

We have a considerable number of women workers in our plant. They play basketball, too. I go to just about all the dances in town, and usually dance at least once with each of our girls there. We often have home parties, and I attend when I am invited—which is most of the time.

My personal friendship with the workers is something I would not give up. Never have I been imposed upon; and the familiarity which has been built up has never—as far as I know—held the slightest tinge of contempt on either side.

The general organization of the work—the second point of the three I mentioned—is important. When I say "organization" I cover it by the entire daily conduct and routine of the plant and personnel.

Never, if there is another way out, do I give orders merely as orders. One of our executives remarked the other day that, to hear me outlining the work, he might almost suppose the other fellow was doing the ordering. Perhaps he is right—but the method gets results. Sometimes, even, I can handle it so that the other fellow believes the suggestion is his own. If it happens this way, so much the better.

I want to make one other point about organization, in connection with building pride in the company. I find that one of the best ways to do this is through our advertising. During the past few years we had so many orders ahead that advertising merely to get more was unnecessary. So I directed the appeal in our copy to the men. Many of these advertisements I had framed and hung up around the plant. They had a big effect on general morale; the workers displayed a lot of interest, and commented on them frequently.

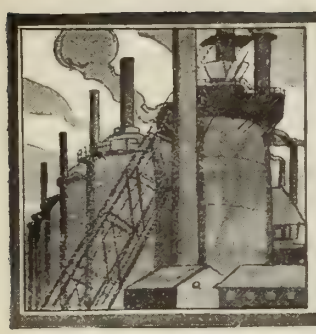
I favor practical welfare work as opposed to the sort which spends a lot of money and gets nowhere. For example, last winter I was told that some local grocers were profiteering. At once we prepared to sell groceries to our people, at cost. The grocers came into line quickly. That's an example of practical welfare work, as I see it.

The first year we came here our gross business was $60,000; last year—our third—it was about $2,000,000. We realized from the start that the best and easiest way to get the friendship of our workers was through friendly co-operation. And the growth of our business has been possible only because the men and women who work in our shops and offices, the men who have invested in this business, and the men who manage it, are real friends.—From *System*.

IF THE best we can do for the foreigner who is regarded as undesirable is to deport him, it is a small tribute to our boasted civilization. Of course, there are cases where no other course is advisable, but have we ever made an honest effort to show the foreigner that we have something better here than he was accustomed to in the land he left?

PORTLAND, ORE., it is reported, will build 5,000 houses to absorb surplus labor. How long will enlightened communities tinker away and simply bridge over conditions that will spring up again when the supposed cure is removed?

IN A Chicago hotel fire 1,700 men escaped in their night attire. In such a case the pyjama habit is much more becoming than the old Mother Hubbard style of nightdress to which some of the sterner sex still adhere.



MARKET DEVELOPMENTS

Old Country Lines Too High to Get Business

They Also Refuse to Put in Tenders as They Are Asked For—Increase in Production of Steel is Well Maintained in Pittsburgh District

IF buying in general were as large as it is with some of the firms in Ontario just now there would be a large volume of business in the iron and steel trade. The firms buying now have Government contracts of one kind and another, and the placing of more ship contracts is going to mean busy days ahead of several of the yards along the Great Lakes and the St. Lawrence.

It is worth noting that British chains and anchors are having trouble in getting into the Canadian market. They were put to the test just this week in a contract, but the business went to a U. S. firm. The price of the Old Country material was about ten per cent. too high, but there is another reason that was against them. There were so many provisions as to price being altered if there were a change of hours, etc., that the figure could not be counted as final. Also the British firms persist in naming a flat price per pound for anchor and chains, combined, while the customer particularly specified that the price on chain and anchor was to be separate. The Old Country firm in question refused to tender in this way and as a result the tender was hardly considered as it could not be compared with other figures that put a price as asked for.

While not looking for higher prices for such lines as sheets, etc., it is worth noting that mills have withdrawn all concessions that have been offered for some time past, and several large sheet mills have withdrawn from the market, booked up for the time at least. One large manufacturer stated this week, "The buyer that puts off too long is going to get left."

Prices on machine tools show no inclination to come down to anything approaching the pre-war state. It seems much easier and more comfortable to stay up than make the effort of a come-down. In fact, predictions of higher prices are freely made.

MONTREAL SCRAP DEALERS AGAIN MARK UP THEIR BUYING SCALE

Special to CANADIAN MACHINERY.

MONTREAL, Que., July 10.—What effect the signing of peace will have upon Canadian business and industry generally, is more or less problematical, as there has been little indication, so far, that the event has been anything more than one of many factors making up the conditions under which we are all working, but it is safe to say that the world at large is more satisfied now that the treaty awaits the ratification of the respective Governments, and when this stage is finally reached, we may look forward to more reasonable consideration of the world's industrial problems. A local steel dealer, recently returned from England, states that conditions there are in a chaotic state and that Canada is fortunate in maintaining the fair state of stability that has been shown since the termination of hostilities. Strike conditions here are still affecting industry, and adjustments are being made in many instances; Canadian Vickers men are still out, but settlement is looked for shortly. Steel requirements are light and dealers, while still optimistic, do not anticipate any marked improvement until the fall. Some little structural material is going, but the demand shows no great expansion in the building lines. As one dealer said: "Manufacturers are only buying to cover their immediate needs. Few are willing to embark on heavy expansion or construction, under existing high costs, with the prospect that building and equipment would deteriorate greatly in value in a few years."

Metal Strength Continues

"Business cannot be said to have shown any marked improvement as a result of peace being signed, but it is undoubtedly true that activity in some lines is of an encouraging character. The movement of metals, while not showing any material increase, is nevertheless of a steady nature and inquiry would imply that the present good demand would continue." This statement, made by a dealer here, seems to characterize the present metal situation. The consumer, it would appear, is still influenced by circumstances and purchases are being made on the basis of existing requirements, little business being placed for future needs. In some respects this might be considered as a good sign, as it would indicate that consumers are not carrying large supplies in face of possible developments. There is, however, little to show that an easier market will arise in the near future; with world business assuming normal conditions, demand for all materials should gradually increase and present high costs of production will virtually prohibit any marked decline in any of the metals with the probable exception of tin, which may develop an easier tone in the coming weeks. Europe's need of copper is well known and a return to normal trading conditions will naturally result in the absorption of large supplies, particularly copper. Montreal dealers are quoting 23 cents for lake copper, and 22 cents for electric and castings, a one cent advance on the week. Tin is firm at 55 cents, with plenty of metal available; trade restrictions are virtually all removed and shipments are quite regular. Spelter and lead are both down ¼ cent, the quotations being 9 and 7 cents respectively. Aluminum demand is steady on a decline of one cent, the price quoted being 35 cents per lb.

Quiet Week in Machine Tools

While business cannot be said to be dull, reports appear to indicate that the past week has been exceptionally quiet, the holiday and the middle summer season being partly responsible for the quiet market, a factor of disinterest seemingly pervading all trade circles. What few sales have been recorded are almost confined to one or two in a lot, and the greater proportion for used equipment. As one dealer put it: "There is generally sufficient to demand our presence at the office, but sales are of a quiet character. While we anticipate better times ahead, these may not materialize for some little time yet."

Steady Demand Maintains Strength

Despite the fact that steel business in this district is below normal, the activity in old material is of a steady character. Local consumption is only fair, but considerable material is going to the States as a result of the better demand from the American mills, many of which are evidently increasing their output. Foundries continue to absorb cast iron scrap, but the volume going in this direction is light in comparison to that of a year ago. Present buying would apparently indicate that little thought is given to future requirements, as the movement of scrap is confined almost exclusively to immediate needs. A factor that assists in maintaining the market at a high level is the fact that much of the material that is brought into the yards is brought in by the small peddlers that go from place to place, gathering up the remnants of the war period. These men insist on high prices for their "product." Dealers take the stuff, knowing that existing conditions point to a period of continued strength, and one that will be further emphasized when developments take a turn for steady and regular expansion. Coppers are quoted up from 1 to 1½ cents, the range being from 13½ cents for light to 17½ cents for crucible. With the exception of zinc, all the scrap metals have been advanced. The same tendency is shown in iron and steel, and advances, while not general throughout the list, are reported on the different lines, principally on boiler plate, malleable and cast iron scrap, the advance being $2, $3 and $2 respectively. Other lines to advance and the current quotations are, heavy melting steel, $12; shell turnings, $7; wrought iron pipe, $9; and stove plate, $15.

POINTS IN WEEK'S MARKETING NOTES

Pittsburgh reports this week state that the production at the steel mills is sustained and real. Buying is becoming larger and more general.

—

Warehouse interests in Canada are buying quite heavily now, on much the same plan as they did before the war. They are placing their needs for three months or so, which goes to make up the sort of tonnage the mills like to get.

—

Montreal scrap metal dealers marked prices up this week. This was not done in Toronto, although dealers in the latter place are ready to admit the strength of the market.

—

Sheets may not go to a higher figure for some weeks, but it is worth noticing that the concessions which many mills have been in the habit of making are being withdrawn, while a couple of mills have gone off the market for the time, booked up.

—

The Canadian National Railways are in the market for machine tools for the Western Canadian shops, and for taps, reamers, etc., for the St. Malo shops, equipment for which was placed some weeks ago.

—

There is a good amount of business in sight in Ontario for the machine tool trade. Of course the used war machinery is still a factor to be reckoned with, but dealers admit readily that it is not bothering them as much as anticipated at the beginning of the armistice.

—

There are several large firms of boiler and engine builders in Ontario that are placing very large orders for steel this week. A large tonnage is involved.

SOME FIRMS TAKE IN LARGE AMOUNTS

But the Business in Several Lines is Largely Local Rather Than General

TORONTO.—If buying in general were as good as it is in some local instances there would be a very large amount of business moving in the Dominion just now. As it is buying is very heavy in some lines, and practically at zero in others.

There are several large propositions under way, and announcement of these will no doubt be forthcoming in a few days or weeks now. There is still the same feeling of uncertainty regarding the outcome of the strike in this district. It is poor business that it is not settled, and the continuance of the strike is doing harm to both sides that it will take some time to overcome.

More Railroad Equipment

The western divisions of the National Railways are coming in for their share of attention just now, and big lists have been out for some days, asking for tenders on a list that has some 60 machine tools of all kinds in it. Many of the dealers have sent in their bids for this equipment, and the award should mean good business.

The same buyers are now in the market for the small tools such as drills, taps, reamers, etc., for the St. Malo shops. The lists for the machine tools for this was out some time ago, and the work was pretty well secured between the Canadian makers and the equipment which the Government had on hand in the gun shop at Quebec.

The chances are that there will be some fairly keen bidding for the last list that is out, viz., the drills, taps, reamers and other similar lines. Some of the agents have been waiting for this business to show up for some weeks, and are well prepared to go and make concessions to land it.

There is a fair amount of buying going on now, and some of the machine tool men are well pleased with the amount of business they are securing. There are several good-sized developments under way, and they are going to count largely in the volume of business that is booked. Buildings are being put up to house good-sized plants. As noticed in previous reports there is no material change the strike situation in this district. It is making the going poor in more ways than one, and business continues to drift into new and strange channels because the people who want work done cannot receive any promises of delivery from the shops. There are rumors, some of them apparently well founded, that say that a settlement is near. Others again say that many of the strikers have left the district to secure work elsewhere.

Concessions are Withdrawn

Prices are firm in the steel market. A. T. Enlow, president of the Sheet Metal Corporation, Hamilton, stated to MACHINERY this week that there was a firmer tone to the market for sheets and kindred lines. "I would not state that we could look for higher prices right away, or even soon," he remarked, "but it is a fact that in nearly all the mills the concessions that have been common for some time have been almost entirely removed, and some of the mills, you will notice, have retired from the market for the time, being well filled with business."

The trouble just now is that buying is too local. Were it as big all over as in some points it would be great. Plates are being asked for in two Ontario shops in very large quantities. In one order there were two items worthy of notice. One was for nine plates with a total weight of 31,000 pounds, another for eight plates that weighed 30,000 pounds. There was enough material to make five cars or so, and the business went through a Toronto warehouse early this week.

Buying In Old Way

"We are buying now as we did before the war," stated on of the warehousemen to MACHINERY this week. "For a long time past nearly all our business has been of the hand-to-mouth sort. We have simply taken the business that came and passed it on to the mills. Now we are buying in quantities that should put our stock in good shape for a quart-

er. Deliveries are spread over this time and will be more or less protected against any increase in price. We do not look for a decline at the present time. In fact prices are firmer, and the man who is putting off his buying is going to be left."

The Old Country Trade

One contract that came up a few weeks ago, and tenders for which are placed this week, called for chains and anchors. Bids were asked from Old Country firms by their Toronto agents, but there is very little chance of them securing the business. In the first place they are high in price, and in the second place they will not place their tenders as they are asked, in order that comparisons may be made with bids from the States. "There were too many qualifying clauses in the English tender," stated the Canadian firm handling this line. They had provisions that meant that their price was off if changes were made in hours of work or half a dozen other things. In fact their bid was not definite enough to put in. Then again the English concerns insist on putting in their bids their own way. They lump the chains and anchor, and put in a price to cover the whole equipment, whereas the firms buying in this country ask for and insist upon a price per pound on chains and a price per pound for anchor. The Old Country houses will simply let us go by the board rather than make the concession."

It is understood that the British firms are still quoting about ten per cent. too high, and, in consequence, the business, or all of it that does not specify Old Country lines, is going to U.S. points.

The Scrap Metal Markets

There is a movement on the part of some of the dealers to let go of a considerable part of their holdings. They figure out that prices are not going to jump very much higher, especially in coppers. In fact it may be that they are now near the level that will make about as good selling as can be expected for some weeks.

Fairly large shipments of iron and steel are being made to the U.S. market. Canadian mills and foundries are not taking up very much material.

STEEL MILL OPERATIONS ARE NOW GETTING CLOSE TO CAPACITY AGAIN

Special to CANADIAN MACHINERY.

PITTSBURGH, Pa., July 10.—Pig iron production in June was at the rate of about 26,100,000 tons a year, the rate showing an increase of an even million tons over the rate in May. This is the first increase in pig iron production since before the war ended. Last September the record rate was attained, 41,900,000 tons, and month by month thereafter there were successive decreases. The turn has now been rounded. It is possible, however, that July will show little if any increase over June, because midsummer brings such high humidity, cutting down individual blast furnace outputs. There is, at any rate, a greater furnace capacity in blast than the average of June.

A curious feature of the showing for June is that the increase in output over May was almost entirely on the part of the merchant furnaces. There was no material increase in the number of merchant furnaces in blast, and the conclusion is that in May some of the merchant furnaces in blast did not produce their full outputs, being gated down, something that is quite feasible with a well built and managed stack. The merchant furnaces have been quite opposed to piling iron. Many merchant furnaces are idle and they will hardly get into blast until they are certain of being able to dispose of their output substantially as fast as made. At the moment there is no such prospect, since the recent buying movement has played out, and, while the furnaces in blast are comfortably filled with orders through the third quarter of the year, and into the fourth quarter, the consumers are no doubt covered in a corresponding way for their requirements. An increased demand for their products is requisite for the development of another buying movement in the near future.

Mill Operations Increase

Steel mill operations on July 1 were running at the rate of fully 65 per cent. of capacity, and there has been a slight further increase since then. A 70 per cent. rate may be attained within two or three weeks as there is a continued tendency to put more capacity in operation since the orders received have been consistently running ahead of the shipments made. The low point in operation was about 50 per cent., at the middle of May, the month as a whole showing an operation of 54 per cent., against 65 per cent. for April, and an estimated 60 per cent. rate in June, the official figures for June not being available as yet.

Now that steel mill operations are increasing, and so sharply, the fact should be pointed out that a 100 per cent. operation, on the basis of the monthly reports used for computing these percentages, is in all probability not necessary to bring about full operation of the steel industry as a whole. The only production reports made are of steel ingot production, but steel ingots are not an ordinary commercial proposition. The demand is for finished steel products, in the various forms of bars, shapes, plates, sheets, wire, etc., produced from ingots through the various finishing processes. It is practically certain that the capacity for producing steel ingots is in excess of the absorbing power of the various finishing departments, this arising from the fact that during the war many additional open hearth furnaces had to be built to produce ingots, on account of the heavy demand for shell steel, which was not rolled through any of the regular finishing channels. The result is an unbalanced industry. In ordinary times the total of finishing capacity has exceeded the ability of the steel departments to produce the raw steel, an excess being necessary because in one year the demand might run more heavily to certain products, and in another year it might run more heavily to others. Steel ingot capacity increased from 35,000,000 tons a year in 1914 to 49,000,000 tons at the present time, or 40 per cent., whereas outside the building of many plate mills there was but little increase in steel finishing capacity. While it is very difficult to estimate, it is probable that the various finishing departments, excepting the rail and plate mills, would probably be filled up solidly before the requirements in ingots ran beyond 85 or 90 per cent. of the capacity. If so, one does not need to look for steel mill operations to attain one hundred per cent. before there is full activity. Taking it that ingot production was 50 per cent. of capacity at the middle of May, and 65 per cent. on July 1, the increase in that short space of a month and a half represented between one-third and one-half the total progress necessary to bring virtually full operation to the steel industry as a whole.

Little Effect from Midsummer

Almost invariably the steel market slows down for July and August, the midsummer months. This year no such seasonal influence has been felt, thus far at least. This is regarded as indicating that business is so ready and anxious to go ahead that it cannot take a vacation, but even if there were some slight relaxation at this time it would be only temporary.

Furthermore a few branches of the finished steel trade are now so well filled with business that they can take no more for early delivery. The butt weld departments of the pipe mills are sold up solidly for several weeks, and the wire mills are practically sold up, particularly on nails. In sheets there is a very fair volume of business on books and delivery promises have lengthened. But before the end of June sheet mills began advising their customers to place specifications for August rollings if they wanted to insure against disappointment.

Labor Supplies

For two or three months past there have been predictions that eventually a labor shortage would develop as manufacturing and building operations should expand, but there was an indisposition to set a definite time for the shortage to develop. Now it is the common observation that the shortage has very nearly put in an appearance already.

There is very little unemployment, yet there are orders on the books of mills and factories and contracts for construction jobs let that will involve the employment of more and more labor week

by week. In addition to increasing employment there is more and more emigration, and some mills have found by making actual canvass among their employees that very considerable percentages of the foreign born intend to go to the lands of their birth as soon as circumstances permit. All talk of prospective wage reductions has, of course, disappeared, and here and there wage advances are occurring.

THE TURN UPWARD HAS AGAIN BEEN MADE IN PIG IRON MARKET

AFTER a steady decline in the output of pig iron since September last, when it reached its highest peak, the turn has again been made upward. The output for June was the highest for any month since that date. Following are reports from various U. S. points:

Pittsburgh.—A slackening off in the market for foundry iron has been noted this week, the reason being that most makers have covered their requirements for the last half. There is no demand so far for Bessemer or basic grades. Prices are keeping firm, with basic at $25.75.

Chicago.—After a heavy rush of business during June, the market is going through a period of rest. It is held that many makers were conservative in their buying for last half, and will have to come into the market again. Enquiries for small lots up to 1,000 tons are still coming in for foundry grades.

Philadelphia.—There is a disposition on the part of some furnace interests to blow in idle stacks as soon as business offers, and this will tend to keep prices from going up. There is one sale of basic reported between 6,000 and 7,000 tons at $26 furnace. Enquiry is weak for foundry grades.

Buffalo.—After the first three weeks heavy buying the last week of June showed a falling off, and the past week's sales have fallen off still further. Third and fourth quarter requirements are responsible for a fair enquiry for foundry grades. The March 21st schedule is being maintained, and the outlook is held to be good.

Cincinnati.—Quite a few sales of small lots, averaging about 500 tons, were made for last half shipment, mostly to Ohio smelters. Sales generally were considered good, but the enquiry is not very brisk. Another furnace will be blown in shortly.

Birmingham.—The demand in this district is keeping steady, and the Republic is reported to be about to blow in another stack. A good volume of sales has been made for fourth quarter, and a large interest is said to be fully stocked up for the last half of the year. The output of iron castings is increasing.

St. Louis.—There have been no changes in price though the market still continues dull. Neither sellers or smelters are willing to engage themselves very far ahead, and it will take an active general movement to make any change.

New York.—A period of quietness has apparently set in in this district. For No. 2x $27 Buffalo is quoted, and the same grade of $28 eastern Pennsylvania. Till ocean freight rates are better export business is stagnant. One sale of 250 tons for Dutch East Indies is reported.

Cleveland.—There has been an easing up after the brisk market movement of the past few weeks, but a fair volume of business was done during the week. Foundries seem to keeping pretty busy, which is keeping up the demand for pig iron. Steel making grades are not in demand.

SCRAP MARKET NOT DOING SO WELL AS IT WAS A WEEK OR SO AGO

The market for foundry scrap is dull, trading being confined mostly to dealers. However, there is a pretty widespread demand for the steel making grades. Following are reports from United States points:

Pittsburgh.—A strong demand for steel making scrap and a short supply are the market features in this district. Heavy steel, borings and turnings are all eagerly sought. The foundry grade is not asked for. Heavy melting steel has sold at $19 per gross ton delivered.

Chicago.—Dealers are buying up Government and railroad scrap as it is offerred at prices which are steadily advancing. Dealers are holding on to their stock in expectation of further advances, but the opinion of the consumers is that prices are too high. This keeps trading within very confined limits.

Philadelphia.—Considerably over 5,000 tons of heavy melting steel has been sold at a price of $18 to $18.75 delivered. Low phosphorus melting scrap is quoted at $23 to $24 delivered, if guaranteed .04 or under in phosphorus. Steel rails for rerolling are quoted at $18.50 to $19.50 delivered.

Buffalo.—With no demand from consumers in the district to or from outside points dealers are doing all the buying in sight. They seem to have no doubt about being able to dispose of their stocks at an advance. Heavy melting steel is quoted $16.50 to $17 f.o.b. Buffalo.

Cincinnati.—With a good demand and improving business nearly all grades of scrap advanced in price last week. Steel rerolling rails are in good demand as is also No. 1 railroad scrap. Heavy melting steel is quoted f.o.b. dealers' yard $14.50 to $15.

New York.—An increase in all grades, but chiefly in heavy melting steel, is noted here. The latter has jumped around $1 per ton in the last week. A 2,000 ton lot of mixed scrap, including about 60 tons copper wire, brought a bid of $20.36, f.o.b. Morgan, N.J.

Cleveland.—A dealers' market in heavy melting steel borings and turnings obtains in this section. Dealers are paying $19 per ton for heavy melting steel, but mills will not offer more than $18.50 for the same grade. Prices are holding firm. $21 is reported to have been paid for low phosphorus melting scrap.

Birmingham.—With consumers pretty well stocked up, the market is dull, and no immediate betterment is looked for. Steel rails are quoted at $12 to $14 per gross ton, and cast iron borings at $6.50 to $7.50.

St. Louis.—From this centre comes the report that the only market is a dealers' market. Scrap offerings have been light at the latter end of the month, but lists put out earlier brought good prices.

BIG FRENCH CONTRACT

Rebuilding of Nancy to be Undertaken —Price is About $250,000,000

A contract for the reconstruction of buildings, bridges and other structures in the district of Nancy, France, has been entered into between the Vulcan Steel Products Company of New York and a committee representing the French Government. McArthur Brothers, one of the largest railroad contracting firms in this country, have received subcontracts covering the excavation and masonry involved, while the McClinton-Marshall Construction Company will supply the bridge and structural steel work. The minimum amount named is $250,000,000, but it is understood that this only a tentative figure and that the final sum involved will probably be considerably more.

Negotiations had been entered into between the committee of Nancy and Rodney D. Chip, general manager of the Vulcan Company, and the contract was signed about a month ago. On account of the size of the project it is not believed that operations will begin before next spring.

At present exchange with this country is heavily against France and with the hope of bolstering the rates, which have declined during the last three months to a point not reached during the war, the French Government has been loath to allow any dealings which would involve further payments to this country. Imports are being strictly controlled and for this reason the announcement of the signing of such a contract was received with some surprise by the financial community.

It is understood, however, that all obstacles have been overcome. The in-

demnity due from Germany under the peace treaty is understood to be the source of the funds which will be used in making payment for the work and it is believed that the Government of France will issue some form of security in anticipation of the indemnity payments. The du Pont interests are arranging the transaction's financial details.

The city of Nancy, just behind the battle line, sustained considerable damage from air raids, though the Germans never turned their artillery upon it, probably because they counted upon possessing the city after the war and did not wish to damage it. The neighboring district, however, sustained great damage.

SHIP CONTRACTS TO BE GIVEN OUT

Statement From Ottawa About Building To Be Carried on This Season

According to information received from the representative of CANADIAN MACHINERY at Ottawa, the Government will shortly give some more contracts for ships to the Collingwood Shipbuilding Company, and the Dominion Shipbuilding Company. They will also give some to another of the St. Lawrence yards.

SERIOUS EFFORT NEEDED ON PART OF CANADIANS TO GET CHINESE TRADE

IT is quite evident that Mr. Ross, Canadian trade commissioner for China, is not greatly impressed with the seriousness of the efforts that Canadians have made in the past to go into the great Chinese market and sell goods to the millions of purchasers there.

This fact and others came out in an interview which CANADIAN MACHINERY had with Mr. Ross during a short stay in Toronto a few days ago. "There is too much pressure on the land in China," remarked Mr. Ross, "as fully 80 per cent. of the four hundred million people live off the land. They have not developed their natural resources to any extent. There is going to be a development in China. I am not disclosing any secrets when I say that certain powers are going to take China in hand," continued Mr. Ross, "and there will be loans made for development purposes."

"What about the machinery situation?" inquired the reporter.

"There will be a market there—in fact it is there now," he replied, "for mining machinery, cotton and flour mills. There are large engineering firms at Shanghai and Hong Kong. There is no reason why our engineering firms should not go into that field and get a fair share of the business that is offering. There will be bridge building to be done on a good scale and other works of a similar nature. Canadians going into that field will understand, of course, that they will have to compete with the world. In such a field they could ask no favors, and they would not be under any particular handicaps. It is as easy to send material to China from Canada as from England. The Chinese market requires steel bars for reinforcing, corrugated sheets, tin plates, wire, nails."

Mr. Ross made it plain that in many lines the goods sent to China would have to be made down to a price. This did not hold good in reference to machinery, and he advised that no Canadian dealer or maker should risk his reputation by putting a machine in that country that would not stand up and do the work. Japan had ruined her chances by this very thing, trying to put inferior material off on the Chinese trade

"Above all else," concluded Mr. Ross, "the Canadian trade has got to make up its mind to get closer to the people of China if they are going to sell to them. It is no use standing ten thousand miles off and dangling the goods in the air. There has never been a serious, concerted effort to capture the trade of that great nation. The Canadian manufacturers have never yet got down to hard pan in this matter. In less than a quarter of a century China will be one of the greatest customers in the world. The English language is all that is necessary to do business with. The opportunity is there, but it is up to the Canadians to get together and seriously enter the Chinese market." Mr. Ross intimated that he was only too pleased at all times to help the Canadian trade, and answer all inquiries about the Chinese field. He can be located by addressing the Department of Trade and Commerce, Ottawa.

PRICES WILL NOT BE LOW

"I am rather a firm believer in the natural economic laws, and I do not find myself in accord with the impression that many people seem to have that the level of prices is not likely to be radically changed over the decade," said John D. Ryan of the Anaconda Copper Co. "I believe that prices must be made that will equalize consumption and production.

"We have seen some sharp adjustments already from war prices, and in every product in which the companies with which I am connected are interested prices have gone back to pre-war averages, and in some cases lower. These products are copper, zinc, lead and manganese.

"I do not believe that the level of prices will fall permanently as low as before the war, but I am convinced that we can now look for gradual adjustments in most staple products. I think prices will have to be put where building and development of all kinds must be encouraged before we will see consumption approach production of the staples.

"I think in the adjustments which are necessary labor will have to contribute its share or unemployment on a very serious scale is bound to result. I hope, however, that the intelligence and foresight of those who have to settle these questions will be such that every consideration of the needs of those who work for wages and salaries will be considered before profits, and that reductions in wages will take place only where it is imperative."

WHAT IS "KINITE"?

Continued from page 33

readily made of "Kinite" can be gained from the accompanying illustrations, which show the rough castings for a large circular die for drawing milk cans. The finished die, shown in the larger illustration, weighs 141 pounds, is 13 in. inside diameter and 4⅞ in. deep. The mean out-of-round, after hardening, was .003, a change so slight that no grinding was required, and as the surface was smooth, showed absolutely no scale, and was so near the required size that it was used just as it came from the fire without any additional work.

A superintendent of a large metal stamping company has been using "Kinite" dies for several years. On a job requiring three "Kinite" dies two of them were in perfect condition after drawing 116,627 pieces, while the third broke off at the point on the 94,227th piece. With regular carbon steel he averaged only 22,000 pieces on the third operation, when it was necessary to rework.

Another "Kinite" die, which he uses for forming a handle from 16-gauge sheet iron, has run 75,000 pieces thus far and shows no wear at all. With regular carbon steel reworking is necessary after 25,000 pieces.

The Kinite Company, of Milwaukee, who handle this product, state that further information will be gladly forwarded to those interested.

Help for Farmers.—The present situation with regard to farm help shortage in Brant County is so acute that the Brantford Chamber of Commerce has appealed to the manufacturers of Brantford to draw this matter to the attention of their men during stocktaking, or when men are let out for any other reason. It is emphasized that wages being paid in the country at the present time are equal to city wages.

INCORPORATIONS

The Alberta Pioneer Canning Co., Ltd., has been incorporatde with a capital stock of $40,000 in 800 shares of $50 each. The company will carry on the business of fruit packers, etc., and the head office of the company will be in Edson, Alta.

The firm of Doheny, Quinlan & Robertson has been incorporated with a capital stock of $2,000,000 in 20,000 shares of $100 each, the head office to be in Montreal. The firm will carry on the business of general contractors and engineers.

BECKER

Belt Driven Millers

The Machine that Gives the Smooth Finish

Stringent shortage of labor during the war put a premium on machinery of superior productive ability. Never was the capacity and value of Becker Millers better emphasized than during that period. And Becker Millers will always continue to demonstrate their ability to return maximum production for minimum expenditure of manual effort.

Send us blue prints of your work and other data and we will submit estimates on Becker production. Adopt this "safety-first" course; it may mean added profits to you.

WELDER IN R. R. SHOP AT NEVERS, FRANCE, RECEIVES D.S.M.

When America put her strong hand to the task of war, nowhere did her effort tell with greater effect than in the great car shops where the men who had linked two oceans and laced a continent with steel, pulled denims over their O. D.'s for the fight behind the lines.

One of these men, Buck Private Matousek, now master engineer, wears the Distinguished Service Medal, and wears it with the satisfaction of knowing that the work he did amid the roaring machines of the great shop at Nevers was worth as much to his country as many a deed of glory at the front itself. Matousek was the man who, upon his own personal initiative, and thanks to his peculiar skill as a welder, saved many thousands of dollars and many thousands of still more precious moments by healing wounded locomotives and putting them back to active service.

The war couldn't have been won without locomotives, and without men expert in the operation and repair of locomotives. What American railroaders and machinists accomplished in France astounded the French railroaders and mechanical experts. It was one thing to bring to France an enormous number of locomotives and cars, together with ample equipment. It was another thing to keep not only these locomotives and cars but many of those of the Allies in order.

One powerful locomotive could haul dozens of cars of munitions to the front. For every locomotive that was put out of the running and stayed out of it, dozens of cars of food, equipment and shells, needed at the front, had to stand still on a side track.

Under the terrific strain of war work the blown-out cylinder was a frequent occurrence. To wait for new parts meant interminable delay. And here Matousek stepped in and, despite the doubt and skepticism of some of his superiors, undertook to repair the breaks himself. He succeeded, and with such results that his work soon took on an importance that it resulted in the award of the D.S.M.

Instead of lying idle for weeks, locomotives that needed new cylinders were ready for action in four hours. Kneeling on the concrete floor, directing the white flame of his oxy-acetylene welding torch with the artistry of an expert, Matousek kept the wheels moving that carried the munitions and the supplies to the men in the forward lines.

Here at the great A. E. F. railroad shops of Nevers, America's effort is still visible. The buildings were made the repair headquarters of locomotives in 1918 and were turned over to the Americans for equipment. This they did with the finest equipment from the shops of the country that lead the world in railroading.

And now, with the war work over, American ingenuity is utilizing the plants as a school of instruction.

From all parts of the A. E. F. hundreds of students have come to Nevers. These men are receiving instruction from such experts as Matousek. The work of the shops goes on, and, right with it, the school work. The students act as apprentices and helpers. They are taking courses in welding, machine shop practice, tool making, heavy railroad blacksmithing and forging, foundry work, railroad electrical work, and other lines. And instead of delaying production, they are actually increasing it.—"Stars and Stripes."

BOOK REVIEW

The Construction of Graphical Charts, by John P. Peddle. The McGraw Hill Book Co. Price $2.

Much of the work of calculation done by the engineer and designer is in the repeated calculation of a limited number of formulae to a variety of different conditions, which involves merely the substitution of different variables in identical equations. Any mechanical means for performing this operation expeditiously will not only lead to a saving of time and mental wear and tear but will also minimize the chances for error. Such a device is the chart or nomogram, and the present work enters into its construction in a very clear and practical manner. Believing that the subject should be particularly useful to the practicing engineer who is often a trifle rusty in some parts of his mathematics, an effort is made to simplify the mathematical treatment. A series of illustrative problems has also been worked out in detail as it was thought by the author that these would afford a clear insight into the methods and a better understanding of the difficulties likely to be encountered than would be possible from a purely theoretical analysis. In the second edition of the work now presented a chapter on the use of determinants, in the plotting of graphical charts, has been added.

Contents

Charts plotted on rectangular coordinates; the alignment chart; the hexagonal index chart; proportional charts; empirical equations; stereographic charts and solid models; the use of determinants.

—From the "Passing Show" (London).

PLAYING POSSUM.

Germany's Statement to Her Creditors.

INCORPORATIONS

The Andian National Corporation, Ltd., has been incorporated with a capital stock of $1,000,000 in 10,000 shares of $100 each. The object of the company will be to search for minerals, oil, gas, etc. The head office of the company will be in Ottawa.

The United States Rubber Co., of Canada, Ltd., has been incorporated with a capital stock of $20,000,000, divided into 200,000 shares of $100 each, the head office to be in Montreal. The company will manufacture and deal in all kinds of rubber goods. The principals are Alexander Chase Casgrain, Errol Malcolm McDougall, Leslie Gordon Bell, Sadie Conrad Demers, and Edward James Waterson.

William Simon Morlock, Sydney Ellis Wedd, Roy Beverly Whitehead and Bruce Victor McCrimmon, solicitors, and Samuel Davidson Fowler, solicitors' clerk, all of Toronto, have been incorporated under the name of the Allied Packers of Canada, Ltd., with a capital stock of $10,000,000 in 100,000 shares of $100 each to deal in hogs, cattle, etc., and make food products of various kinds. The head office of the company will be in Toronto.

PHILADELPHIA FOUNDRYMEN'S ASSOCIATION

The above association held its 228th meeting at the manufacturers' Club, on Wednesday evening, June 4, 1919, at 8 o'clock, this being the last meeting until September.

The program for the evening was as follows:

H. A. DeFries, chief engineer of Hamilton & Hansell, Inc., Park Row building, New York, showed slides and gave a talk covering the Rennerfelt electric arc and melting furnace for melting steel, brass, copper, nickel, ferro-manganese, etc.

He based his explanations chiefly on the points of applying the proper way of electric heating at the proper moment. These points were not included in their last address.

Don't forget the A.F.A. and foundry exhibit beginning the week of September 29, at the Commercial Museum, 34th and Spruce Streets, West Philadelphia.

It will be the greatest event of the foundry world, as England, France and Italy will be there to show America what they learned in foundry practice during the world war.

The members of this association will give the delegates and their women folks a most cordial welcome.

The above is respectfully submitted.

THOS. DEVLIN, President. HOWARD EVANS, Secretary.

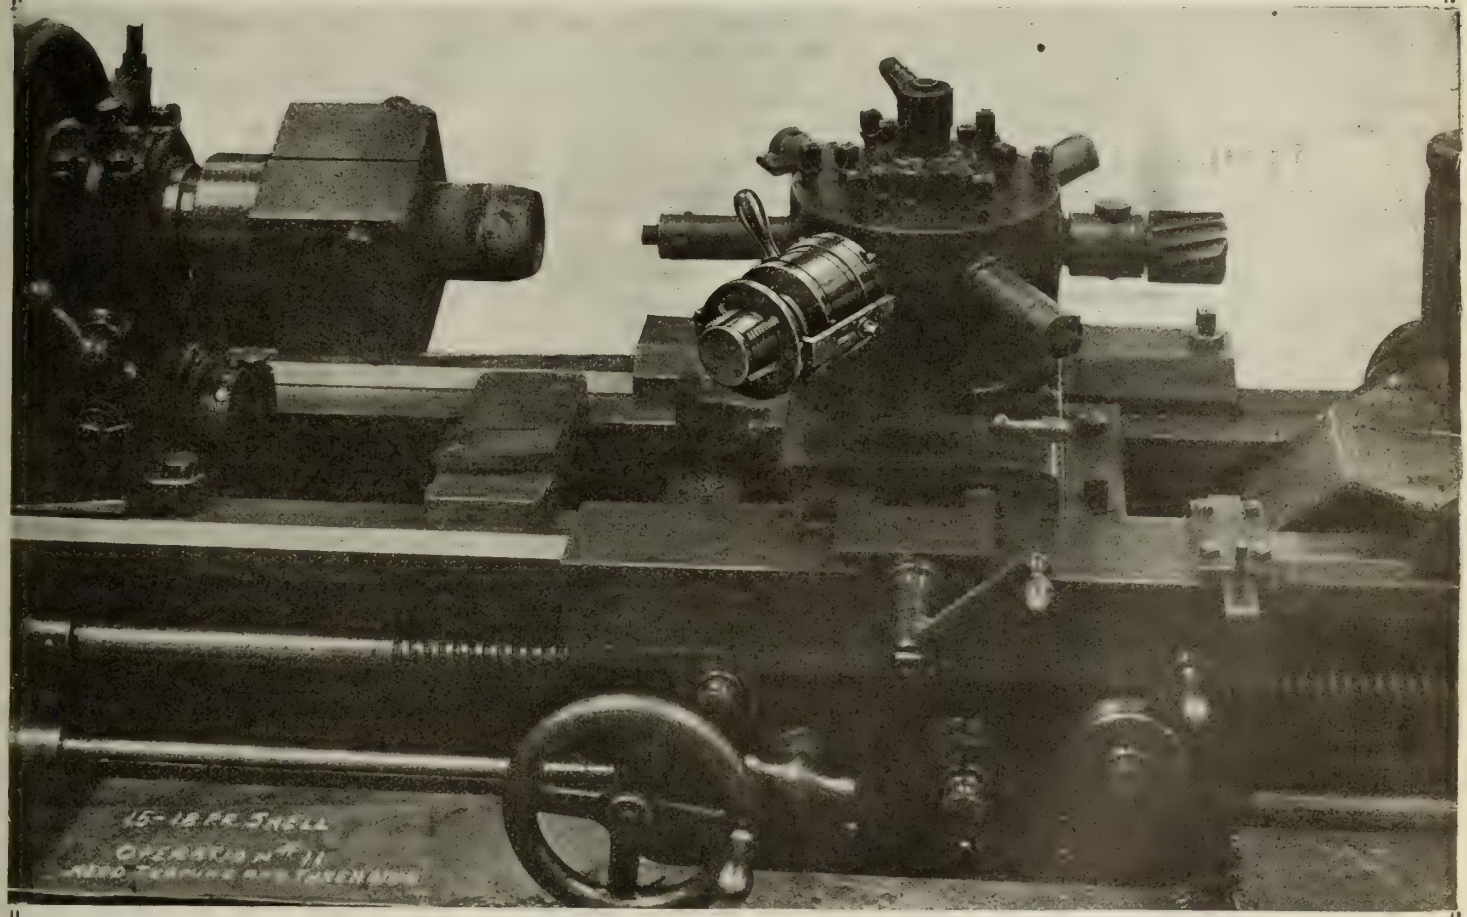
ANOTHER GEOMETRIC FEAT

DESCRIBED IN A LETTER FROM CANADA

Messrs. Geometric Tool Company,
New Haven, Conn., U.S.A.

Gentlemen:—

"The engine lathe shown in the photograph which we are sending you commenced work on shells within four months of the start of the war, when methods were in course of development, and special machines were unknown. Material and labor were both frequently unsatisfactory. Rejections due to poor threads were



frequent troubles with shell makers. Despite many adverse conditions the contract was successfully completed, and the Geometric Tap used on this lathe (fitted to cross-slide on carriage) was an important contributing factor in the good work done in the early strenuous times."

Very truly yours,

Whether yours is a tapping or threading job, or both, you would be satisfied with the Geometric way of doing it.

The Geometric Tool Company, New Haven, Conn., U.S.A.

CANADIAN AGENTS:
Williams & Wilson, Ltd., Montreal. The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg, St. John, N.B.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

MUNICIPAL

Ottawa.—The proposed new Cummings bridge will cost about $200,000.

Simcoe.—The public utilities commission is going to buy a centrifugal pump for sewage disposal work.

Chatham.—An engineer is to be engaged to go over the situation here and report on the best plan for a waterworks system.

Elora.—Tenders are being received for a steel bridge 75 feet long over the Grand River. S. Aitcheson, reeve of Pilkington, is the party to address.

TENDERS

The Ministry of Lands and Forests will receive tenders up till the 16th July, for the right to cut timber on Groves and St Louis Townships, in the District of Sudbury. All particulars can be obtained from the Minister or from Mr. Charles Henderson, Crown Timber Agent, Sudbury.

The Manitoba Department of Public Works will receive tenders up till July 10th for materials in connection with construction of a transmission line between Winnipeg and Portage La Prairie. All information can be secured from J. M. Leamy, Engineer of Mechanical Services, New Parliament Buildings, Winnipeg.

The Galt Housing Commission are asking for sealed tenders for all trades required in the erection of fifty houses, half to be of four rooms and half to be of six rooms. Alternative tenders for one hundred houses, half to be four and half to be of six rooms, are also asked. Plans and specifications can be obtained from Messrs. Evans & Hall, 30 Water Street, Galt, Ont.

Tenders will be received, by registered post only, addressed to the Chairman of the Board of Control, City Hall, Toronto, up to noon on Monday, July 21st, 1919, for the construction and delivery of 16-inch lapwelded steel pipe. Specifications and tender forms for the foregoing may be obtained upon application at the office of the Water Main Extension Section, Department of Works, Room 320, City Hall, Toronto.

TRADE GOSSIP

New Pulp Mill.—Advices from Bear River, N.S., state that work has started on the new mill for Clarke Bros. The buildings will consist of a pulp mill, saw mill, boiler room and machine shop.

London's Motor Industry.—The Republic Motor Truck Co. of Alma, Mich., are planning the erection of a factory in London, Ont It is understood that the buildings will cost in the neighborhood of $500,000.

Factory Extensions.—Two Arnprior firms are making plans for extensions and additions to their factories. The Arnprior Cabinet Co., Ltd., are about to make two additions to their present plant, and F. C. Hyck & Sons are making extensive alterations to their premises.

New Firm Incorporated.—The New Brunswick Typewriter & Specialty Co., Ltd., with a capital stock of $24,900, and headquarters at St. John, N.B., has been incorporated. The principals are H. C. Parker and C. F. Wetmore, both of St. Johns, and Pearl Soulis, of Halifax.

The Bastian-Blessing Company, Chicago, have issued a booklet on the Rego welding and cutting apparatus, which goes into the details of this equipment in a very thorough manner, and lists, together with the prices, the various types of complete welding sets and torches made.

Lumber Prices Increase.—An increase of $2 per 1,000 feet in all grades of lumber is in effect This is due, it is alleged, to the appearance of American buyers in the British Columbia market, who are competing with Canadian dealers, thereby enhancing the market value of the lumber.

Going Ahead.—The R. McDougall Co., Ltd., Galt, were not seriously inconvenienced by the fire which took place in their plant recently. The machine shop and foundry were uninjured, and the patterns that were burned or injured have been largely replaced. Their deliveries on their usual lines have not been interfered with.

Praise for Board.—The British Minister of Munitions has sent a cable to the Imperial Munitions Board congratulating them on the report of their war expenditures. The British comptroller and auditor general report that the accounts of the I.M.B. are highly satisfactory, and the manufacturing establishments controlled by the Board very successful, the accounting arrangements having reached a high standard.

Protest Against Demurrage.—The proposal of the railways to charge $2 per day on all cars at the seaport not unloaded after twenty days will be protested by the Guelph Chamber of Commerce. The matter will come before the Railway Board at an early date. The ground taken by the Chamber of Commerce is that any delay which may occur after the goods are shipped is due to the railway company and not to the shippers.

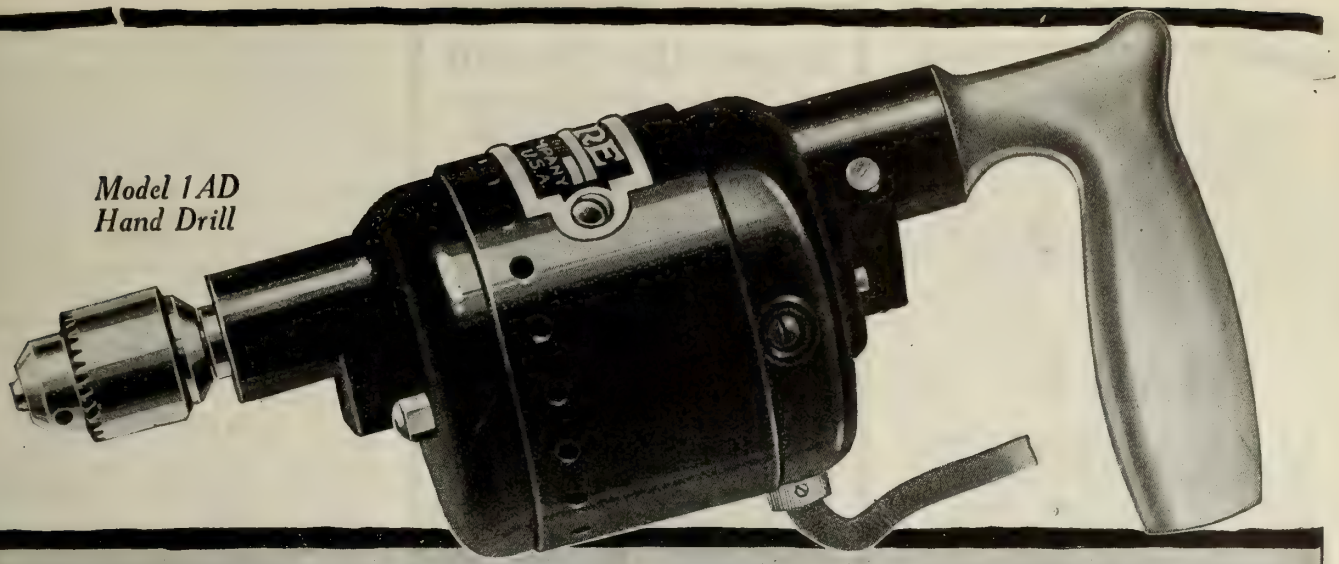
New Pumps for Guelph.—The Fire, Light and Water Committee have recommended the acceptance of the tenders of the Goldie McCullough Co. for the installation of a 750 gallon pump with a 75 h.p. Crocker Wheeler motor, at $2,904, also a 1,250 gallon pump with 125 h.p. Crocker Wheeler motor for $3,640. The Bawden Pump Co. secured the order for a 2,100 gallon booster pump with 100 h.p. Crocker Wheeler motor for $2,621.

Get Big Contract.—The Vulcan Steel Products Co., of New York, has secured a contract for rebuilding the war swept district of Nancy, at a figure estimated at $250,000,000. It is understood that this figure may be increased to $500,000,000 before the task is finished. Two of the largest contracting firms in the United States are associated with the Vulcan Co. in the contract, the McClintock Marshall Co. and the McArthurs Bros. Co.

New Industry for Collingwood.—The firm of Edwards & Co., industrial brokers of Toronto, have given the Chamber of Commerce a written statement that if they succeed in financing the proposed industry for the manufacture of hard rubber goods, the industry will be located in Collingwood Mr. Duff, of Edwards & Co., is selling stock in the proposed industry in Collingwood and the district.

Trade Commissioner's Visit. — The British Trade Commissioner, Mr. Field, is visiting Sarnia with the object of promoting British overseas trade with local concerns. Samples of German and Austrian goods used in the district before the war will be obtained, and an effort made to get these lines manufactured by British firms will be made. Invitations have been extended to Mr. Field by several of the local manufacturers to visit their plants, and he will be enabled to get in touch with the manufacturing and labor conditions in the district.

Skilled Mechanics Leave. — It is stated by Mr. G. F. Doolan, one of the delegates who interviewed Sir Robert Borden on behalf of the metal trades, that many of the skilled mechanics who are members of the Amalgamated Society of Engineers are booking or have booked their passage to the Old Country. The reason he gives is that the industrial situation in Canada is such as to make it absolutely unattractive, and they have more confidence in the British Government's efforts to ad-



Model 1AD Hand Drill

MODEL 1AD Hand Drill

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, brass, aluminum and alloys, 0 to $\frac{3}{16}$ inches.

Motor—Universal, operates on either direct or alternating current. Diameter of motor 3⅜ inches.

Spindle—Offset from center $\frac{25}{32}$ inches.

Drive—Helical gears.

Handle—Aluminum. Complete with 10 foot cord, plug, switch and chuck. Jacobs chucks used as regular equipment.

MODEL 2AD Sensitive Drill

Height—18 ins. **Weight** 18 lbs.

Stroke—3¼ ins. **Feed**—Rack and pinion. Helical gear drive.

Capacity—Steel, brass aluminum and alloys, 0 to $\frac{3}{16}$ inch. Drills to center of 7½ inch piece.

Motor—Universal, operates on either direct or alternating current. **Diameter**—3⅜ inches.

Spindle—Offset from center $\frac{25}{32}$ inches.

Thrust—Ball bearing.

Table—Adjustable, may be raised, lowered or swung entirely out of the way. Complete with 10 foot cord, plug, switch and chuck. Jacobs chucks used as regular equipment.

just the industrial situation than those of the authorities at Ottawa.

A Disappointment.—Such little relief as Canadian shippers may have looked for in August by the release of vessels now used as transports for Canadian troops seems likely to be offset. The British Ministry of Shipping is understood to have decided to take 70 per cent. of all cargo space next month leaving only 30 per cent. for commercial purposes. This is an unpleasant surprise for the Canadian exporters, as this month only 50 per cent. of space had been commandeered for Government purposes and it was hoped this would be lowered to 40 per cent. in another thirty days. This new move will make the Canadian shipping problem, already rather hopeless, almost insoluble if no change is made.

PERSONALS

Corporal William A. Nugent, who served during the war in Company I, 21st Engineers, has returned from France and resumed his duties with the Independent Pneumatic Tool Co. as traveling representative. He has been assigned to his old territory in Indiana.

MARINE

Cleveland.—Artificial fog in the way of smoke from the burning Ontario forests held up the fleet on the lakes from midnight till daylight at the Soo. Even for some time after the coming of dawn movement was difficult in the hazy atmosphere.

St. Thomas.—The long search for the missing car ferry, "Bessemer," is at last to be abandoned. Capt. Clarke, of Toronto, has supervised the dragging of Lake Erie from end to end, without succeeding in getting any trace of the vessel, although the operations were continued all last year, and up to the present time.

Halifax. — A tern schooner was launched recently from McKean's Shipyard, Tuft's Cove, after being under construction since August last. The hull is constructed of hard pine and Douglas fir. Dimensions are 155 feet overall by 33 feet 2 inches beam by 12 feet depth. She will be rigged as a three-masted fore and aft schooner.

St. John, N.B.—The number of American vessels loading lumber in the port of St. John makes many of the old timers sigh for the good old days of the wooden sailing vessels. These fine ships, owned in Nova Scotia and New Brunswick, carried lumber from St. John and Halifax and other Maritime ports to the United Kingdom, loading thence for the East, and coming home with tea from China or wool from Australia, to reload lumber and repeat the voyage.

Esquimalt. — The Canadian patrol boats, "Armentieres," "Givenchy," and "Thiepval," arrived at Esquimalt recently after a voyage from Halifax, N.S., by way of the West Indies and Panama Canal. The "Stadacona," their flagship, was damaged in a gale off the

coast of Oregon and had to be towed into San Francisco. She sustained the loss of her rudder, and after being repaired will proceed to Esquimalt to rejoin her squadron.

Ottawa.—The present position of the Canadian Government steamers is as follows: The "Canadian Ranger" is at Liverpool. "Canadian Warrior," bound from Cuba to Canada. "Canadian Recruit," bound from Canada to West India and Cuban ports. 'Canadian Voyageur," loading for same ports. "Canadian Volunteer," loading at Victoria, B.C. Two vessels are receiving their finishing touches at Vickers, and three more are expected from Great Lakes yards in the near future.

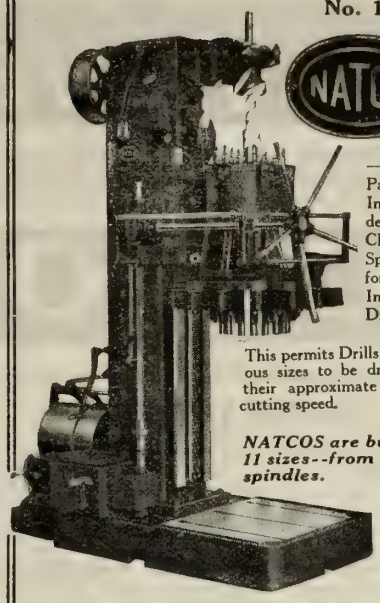
Gore Bay.—Capt. Alexander Cunning, wrecking master of Great Lakes Towing Co., has been successful in his suit against the Erie & Western Railway. This was in connection with the salvage of the steamer "Wissahickon" in 1910, when the vessel was in the hands of the wrecking company. She was looted of property worth $45,000, and Capt. Cunning was accused of complicity in allowing his crew to do the robbing. He was arrested and subsequently released on bond. and in turn brought suit against the E. & W. R. for $50,000. The Chicago court has awarded the Captain $10,000, and completely vindicated him of the charge of complicity.

Vancouver.—The harbor commissioners who were appointed in May, 1913, under the act passed in that year. have been asked by the Minister of Marine to hand in their resignations. A clause in the appointment reads, "During the Minister's pleasure." The reason given for the request for resignation is that the Minister wishes to have a free hand in the expenditure of the $5,000,000 recently voted for harbor improvements. The Board will probably be reconstituted with the same personnel as at present with the inclusion of at least one returned soldier. The present Board consists of F. C. Carter Cotton, chairman; J. A. Fullerton and S. McLay, Board members, and W D. Harvie, secretary.

Montreal.—The Canadian Government Merchant Marine. Ltd., is getting rounded into a fully equipped organization rapidly. A manager for the company has been secured in the person of Mr. R. B. Teakle, with headquarters at the C.N.R. offices on St. James street. Mr. Teakle, who is a Canadian, was associated for a number of years with the Allan Line, and later with the France-Canada S. S. Co. Other members of the staff are Mr. H. Milbourne, marine superintendent, formerly of the Royal Line; Capt. H. E. Webb, traveling marine superintendent; Mr. W. A. Cunningham is export and import freight agent. Another former Allan Line man is Mr. Thos. M. Todd, auditor of the company.

The Hayes Wheel Co. have been granted letters patent to increase their capital stock from $200,000 to $1,000,000, the increase to consist of 8,000 shares of $100 each.

No. 14



—with Patented Independent Change of Speed for each Individual Drill.

This permits Drills of various sizes to be driven at their approximate correct cutting speed.

NATCOS are built in 11 sizes--from 2 to 72 spindles.

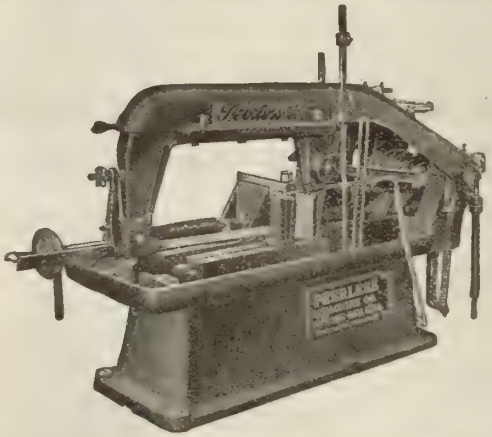
Peerless HIGH SPEED

Has Proven Its Efficiency Where Others Have Failed



DON'T turn down the "Peerless" because you have tried out other hack saws which did not answer your requirements.

Many concerns who were persuaded only with the greatest difficulty to try their first "Peerless," because they "just knew it would turn out like the others," are to-day among the largest and best-satisfied users of our High-Speed Saws.

The "Peerless" is different—and better. It does 50 to 100 per cent. more work, cuts with thinner saws and requires a minimum of attendance, saving time, labor, material, blades and floor space. What is your work? We can tell whether the "Peerless" will do it, and back our judgment with a 30-day trial. If it doesn't make good we pay freight both ways. Well?

PEERLESS MACHINE CO.

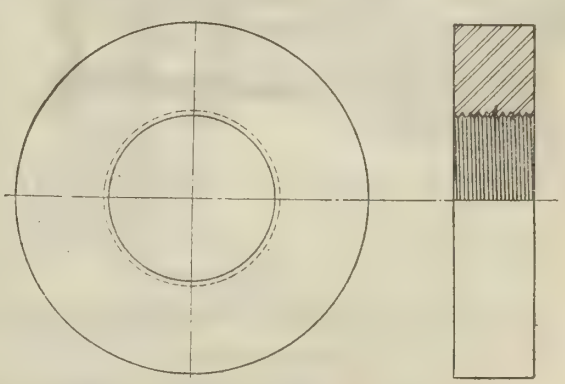
SMALLEY

GENERAL THREAD MILLER

Reduces Cost of Production

To the manufacturer who cuts threads in quantities the Smalley-General Thread Miller is urgently recommended. It turns out a larger volume of work in less time than any ordinary machine. Let us prove it! Send us a blue print of what you consider the most difficult thread milling operation in your plant. Or better still, send us samples of the work at our expense for actual test. Our engineering department will give you a time-study and a detailed report of the operation. The test will be fair, practical and convincing. It will prove the ability of the "Smalley" machine on your particular work.

You have everything to gain—take advantage of our offer now.



The Proof in Detail

We herewith give a practical demonstration of the Smalley-General Thread Miller's work:
MACHINE—Smalley-General Thread Miller No. 2. Air collet chuck.
PIECE MILLED—Threaded collar.
THREAD—Diameter 2¾", length 1¼", 8 pitch thread U.S. standard.
LIMITS—.001.
MILLING FEED—25" per minute. Not limit of machine but of hob. Job also faced at same chucking.
MATERIAL—Machinery steel.

ARMCO IRON Welding Rods

OXY-ACETYLENE ELECTRIC

make *Safe* welding easy

ARMCO IRON Rods are practically pure iron and are peculiarly free from the sulphur, phosphorus, slag, oxides and other impurities that ordinarily destroy the homogeneity of the weld.

You will find it decidedly to your advantage to give ARMCO IRON Rods a careful test.

The HURLBUT, ROGERS CUTTING-OFF MACHINE

Cut Down Cutting-Off Costs

With the Hurlbut, Rogers Cutting-Off and Centering Machine you can double the amount of work now done, thereby reducing your cutting-off cost one-half.

The cutting tools are arranged so that one is cutting up while the other is cutting down, both tools working in the same cut, and one tool acting as a rest for the other. The machine is tried and proven—it is in hundreds of shops. Write for details.

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

Don't Read This Ad—

If You Want To Throw Away Money

on transmission troubles. As you well know, there's no easier way to spend money than on power losses, hot boxes, lubrication, etc. Thousands are spent yearly in fighting these evils. But, if you are reading this ad, you are tired of paying for these troubles. Good! Here's the panacea: **Chapman Type Ball Bearings** are durable almost to the point of permanency; save an average of 20 per cent. on power; eliminate 75 per cent. of your friction losses, and 95 per cent. of lubrication and attention. All your power is delivered to your machines. And they fit the frame you now have in your shop.

You have read this ad. Then find out about Chapman Bearings for your shafting hangers, pillow blocks, loose pulleys, friction clutches or wherever you employ bearings.

"The Marshalltown Throatless Shears"

guarantees perfect work at less than half the ordinary expense.

Rotary, self-feeding shears designed for cutting in and out curves, straight or irregular shearing, circles, also beveling and splitting of plates. Built in various sizes having capacities from tin up to ½" thick. No limit to the size of sheet being cut. Hand, belt or motor drives. The last word in metal cutting shears. We also manufacture Rotary Bevel Shears, Splitting Shears and Plate Milling Machines.

Let us know your requirements.

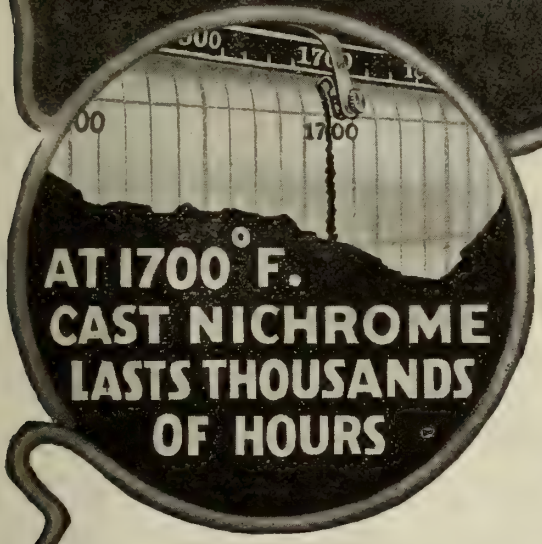
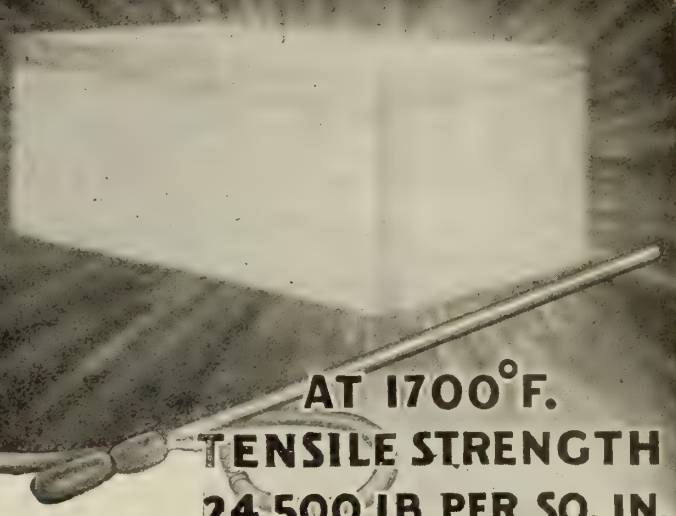
NICHROME
the Casting Durable





Nichrome Castings at High Temperatures

At a red or white heat, cast Nichrome will bend rather than break. A 20 lb. sledge, repeatedly striking the unsupported centre of a plate of cast Nichrome, ¾ in. thick and heated white hot, will merely cause a gradual bending.

The tensile strength of cast Nichrome is 30% greater at 1500° F. than that ot cast iron at 70° F.

Being exceptionally strong, cast Nichrome heat treating containers can be made light, afford great conductivity of heat, and requires less time for the completion of the heat treating process.

Nichrome castings are made to endure at high temperatures.

Nichrome castings are extensively used for annealing boxes, carburizing boxes, pots and tubes, and heating retorts.

Write for further particulars. Manufactured under Henderson Patents.

9" x 4' "Star" Lathe

"STAR" LATHES

"STAR" Lathes Are Built in 9-in., 11-in., 12-in. and 13-in. Swing Sizes.

SAVE—

(1) Save in first cost.
(2) Save in floor space.
(3) Save in power.
(4) Save heavier machines for other work.
(5) Save by increasing production.

"Star" Lathes are built by a concern which has devoted 36 years to producing high grade lathes, and they have the strength and accuracy for the most exacting requirements.

The appreciable savings secured by many prominent manufacturers by using "Star" Lathes can likewise be had in your shop.

The SENECA FALLS MFG. CO., INC., 366 W. Fall St., Seneca Falls, N.Y.

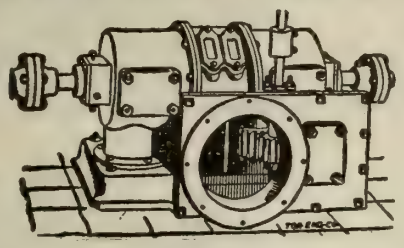
WATER POWER DEVELOPMENT



Over forty years' experience in designing and installing special turbines, both on vertical and horizontal shafts.

Can supply complete equipment, including flume, turbine and power transmission.

Stock of standard vertical shaft Little Giant Turbines on hand for prompt shipment.

We solicit your inquiries.

J. C. WILSON & CO.

BELLEVILLE, ONTARIO

H. COLLIER SMITH

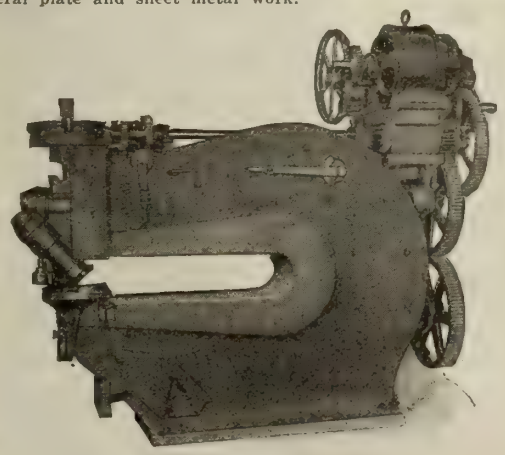
"QUICKWORK"

Registered U.S. Patent Office

ROTARY SHEARS

Made in 6 Sizes

Cut all gauges of sheet and plate metal up to 1 inch thick in straight or irregular shapes and openings without cutting in from side of sheet. Leaves square, true edge that requires no finishing. Used in building ships, boilers, tanks, cars and general plate and sheet metal work.



Patented June 3rd, 1913

SAVES 50% TO 90%

Eliminates Oxyacetylene Cutting and Plate Planing

Write for Catalogue

THE QUICKWORK COMPANY, ST. MARYS, OHIO, U. S. A.

Dominion Foundries and Steel, Limited

Hamilton Ontario

Steel Products

Open Hearth, Basic and Acid, Electric and Alloy Steels

Castings

For Ships, Railways, Rolling Mills, Gears, Machinery and Ingots to 35 tons

Railway Specialties

Penn Couplers, Bolsters, Truck Side Frames, Draft Gears

Forgings and Billets

Heavy Ship Forgings, Locomotive and Car Axles, Miscellaneous Forgings

Plates

Plates and Heavy Sheets to 30 inches wide, Soft and High Carbon
Automobile Plates and Sheets

Agricultural Steel

Soft Center and Solid Plow Steel, Harrow Discs, Shovel Steel, Cultivator Blades

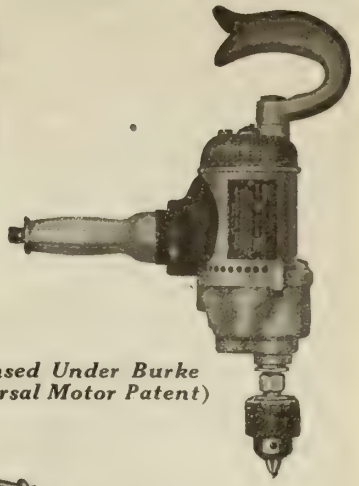
Thor

Electric Drills and Grinders

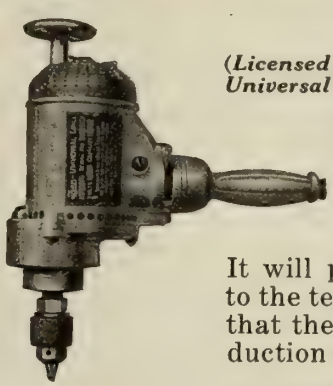
The only Electric Tools equipped throughout with ball and roller bearings.

Light, Powerful and Durable



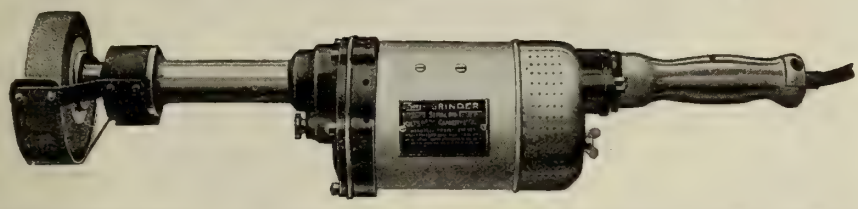
Thor Electric Tools have off-set spindles —which permit operating in close quarters—a variety of speeds, S K F Ball Bearings, four contact switches, D.C. or Universal Motors and several other features that make them the super-tools of the day. Jacobs Chucks used as Regular Equipment.

(Licensed Under Burke Universal Motor Patent)



PORTABLE ELECTRIC GRINDER

Equipped with Universal Motor for Operating on Direct or Alternating Current 110 TO 250 VOLTS



It will pay you to put them to the test and let them prove that they'll reduce your production cost.

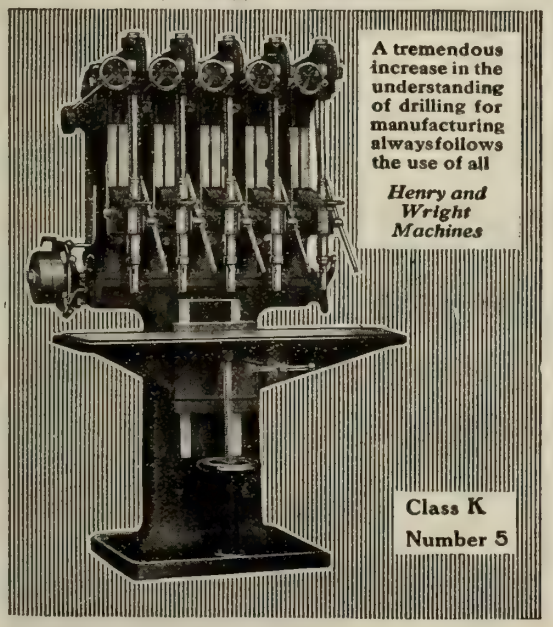
HENRY & WRIGHT

Drilling Machines



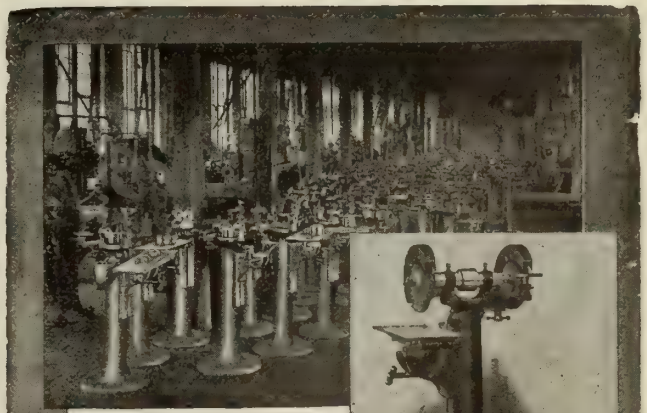
A tremendous increase in the understanding of drilling for manufacturing always follows the use of all *Henry and Wright Machines*

Class K
Number 5

The Henry & Wright Mfg. Co.

Hartford, Conn.

Canadian Fairbanks-Morse Co., Montreal, Toronto, Winnipeg; A. R. Williams Machinery Co., Toronto, St. John, N.B.; H. W. Petrie, Ltd., Toronto; Williams & Wilson, Montreal; Rudel-Belnap Machinery Co., Montreal; Canada Machinery Corp., Galt, Ont.; Geo. F. Foss Machinery & Supply Co., Montreal; General Supply Co., Montreal.



WE BUILD THEM BY HUNDREDS

Standardized Production enables us to offer this powerful Waterbury Grinder at such a low price. It grinds rapidly and accurately, all flat surfaces, dies, punches, planer, lathe, and other tools. Has adjustable table and tool rest with large radius of travel. Rigid, 3-point table supports giving great steadiness. A reliable, practical grinding outfit.

"THE MACHINE
THAT GIVES THE
SMOOTH FINISH"

All gear driven spindles lack flexibility and induce vibration through the unavoidable progressive development of back lash between gears resulting in vibration and hammer action which has a crumbling effect upon the cutter teeth and leaves chatter marks on the finished work.

With the Becker Elastic Belt Drive, this gearing is eliminated.

Write for Circular 0-702.

Production of Rare Quality at Lowest Labor Costs

There is unusual strength, accuracy, speed, convenience and range in

AURORA
Drilling Machines

You can use them to great advantage on any work in your shop that's suitable for a machine tool of this kind. The operating is easy and the labor cost comparatively low.

Drop a line for full particulars and specifications.

LANDIS

SUPERIOR DESIGN

BORING, MILLING AND DRILLING MACHINE

"This is the best designed and best built Boring Machine I have ever seen."

This is the comment of one of America's foremost machine tool manufacturers upon examining the new LANDIS Boring, Milling and Drilling Machine.

Users invariably agree with this opinion. The LANDIS Boring Machine has already laid the foundation for the same world-wide reputation for merit that its brother, the LANDIS Grinding Machine, enjoys.

Wherever Pipe is Cut or Threaded Economically

The probability is two to one that it's a

Williams Pipe Machine

that's on the job.

For in approximately two-thirds of all the larger plants in this country Williams' Pipe Machines are used.

It was the Williams Pipe Machine that brought highest honors home from the Panama Exposition.

The Machine illustrated has a capacity of 21½" to 12". Also nine other sizes to meet your requirements.

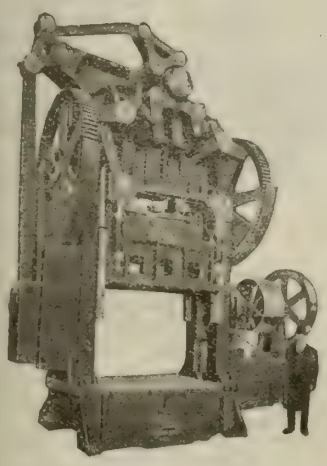
The "TOLEDO" Toggle Drawing Presses



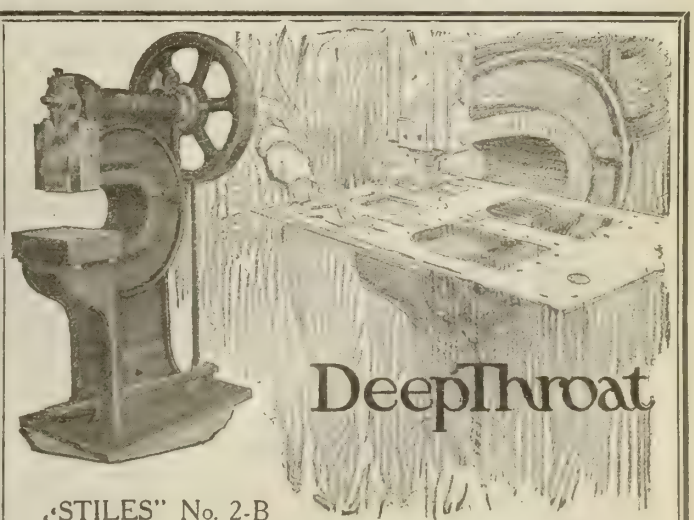
Simplicity of design, sturdiness of construction with scientifically proportioned weight, and the patented toggle mechanism assure unfailing performance and the most economical and accurate results.

We particularly solicit investigation of the advantages of this toggle mechanism—it has NO competition.

The Toledo Machine and Tool Co.

Toledo - - Ohio

Representatives—Allied Machinery Co. of America, 19 Rue de Rocroy, Paris, France; Via XX Settembre 12, Turin, Italy; 16 Seidengasse, Zurich, Switzerland.



"STILES" No. 2-B

For reaching into the center of large sheets of metal, this model of the "Stiles" type of Press is provided. The massiveness of the frame and its special design make it rigid, even under the most severe punching strains.

Whitcomb-Blaisdell Planers

WHITCOMB-BLAISDELL LATHES AND PLANERS PLAY SOME PART IN THE MOST OF THE HIGH-GRADE MACHINE TOOLS MADE ON THE CONTINENT.

ALL-ROUND machines for high grade work, they are equipped with special labor-saving attachments that add to their convenience and enable the operator to "speed up" without endangering accuracy.

ILLUSTRATION SHOWS

a Whitcomb-Blaisdell Planer machining the head post of a Universal Boring Machine—a machine with a nation-wide reputation for accuracy.

May we send you our catalogue giving full particulars?

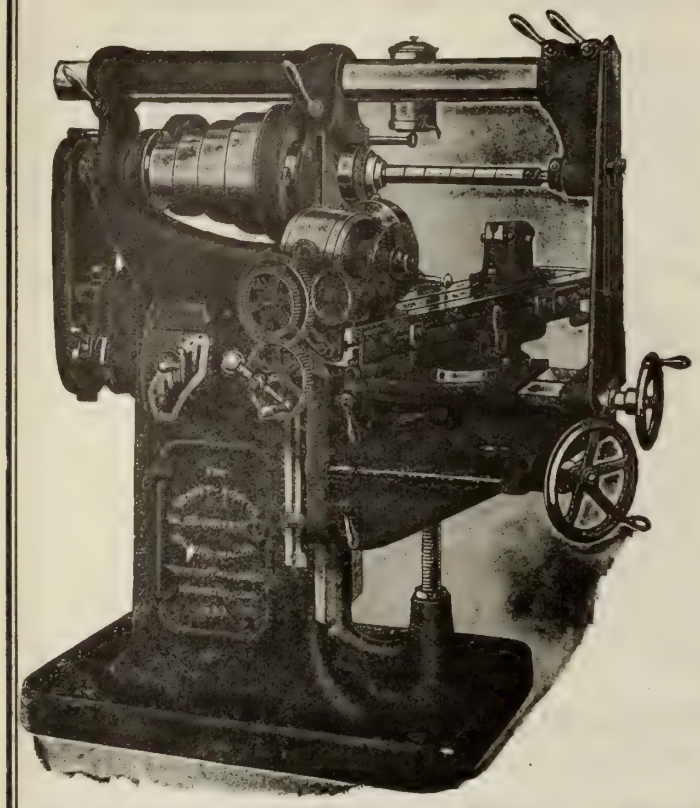
Anybody Can Operate This Miller

and Turn Out a Pile of Work so Simple to Operate is the

"HENDEY"



Skilled mechanics are scarce these days—but anyone can run a machine of its simplicity and turn out work accurately and fast without trouble.

All Feeds positive driven through gearings giving 18 changes.

This is the universal type—designed to handle all milling operations performed on machines of this character, either with regular equipment or by aid of attachments, which can be supplied for increasing efficiency and scope of machine.

Foss MACHINERY AND MILL SUPPLIES

Foss

"Superior" Grinding Wheels

Fast and Cool Cutting

Durable and Uniform

Vitrified Silica or Semi-Vitrified and Elastic process.

Shapes: Dish or saucer wheels, cups and cylinders. Also special shapes for drill and tool grinders. All sizes, grits and grades, 3/8 in. diameter and up.

It is most important that the proper shape and quality of grinding wheel is used for every job.

"FOSS" Service gives special attention to using the right wheel in the right place. We have a large stock of shapes and qualities on hand for prompt shipment.

Tell us your needs and you'll get the wheel that will serve you best.

We are representatives for the following lines:

TUNGSTEN SAW BLADES.
MOORE BROS. FILES.
GRAY PLANERS.
FRASER GRINDERS.
MUELLER RADIAL DRILLS AND LATHES.
SIDNEY ENGINE LATHES.
CINCINNATI ELECTRIC DRILLS AND GRINDERS
ELMIRA WOOD SPLIT PULLEYS.
STANDARD BOLT CUTTERS.
RACINE MACHINE SAWS.
McARTHUR BELTINGS.
WALLACE BENCH PLANER.
KEMPSMITH MILLING MACHINES
SEBASTIAN LATHES.
MONARCH LATHES.
CHAMPION TOOLS.
SILVERS DRILLS
SWEETLAND CHUCKS
SMITH & MILLS SHAPERS
and many others.

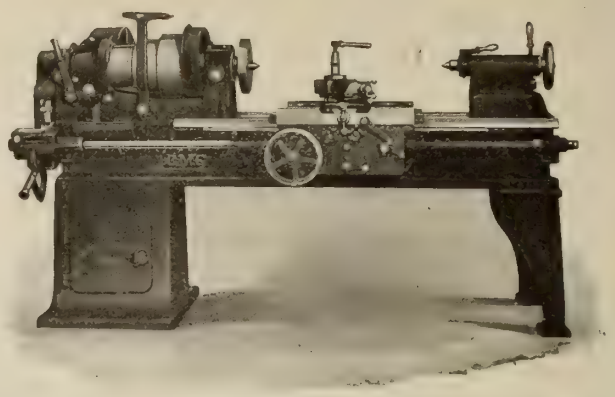
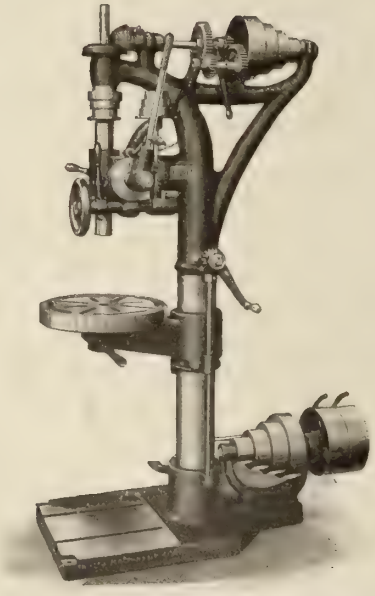
A NICE OUTFIT
FOR THE SMALL SHOP

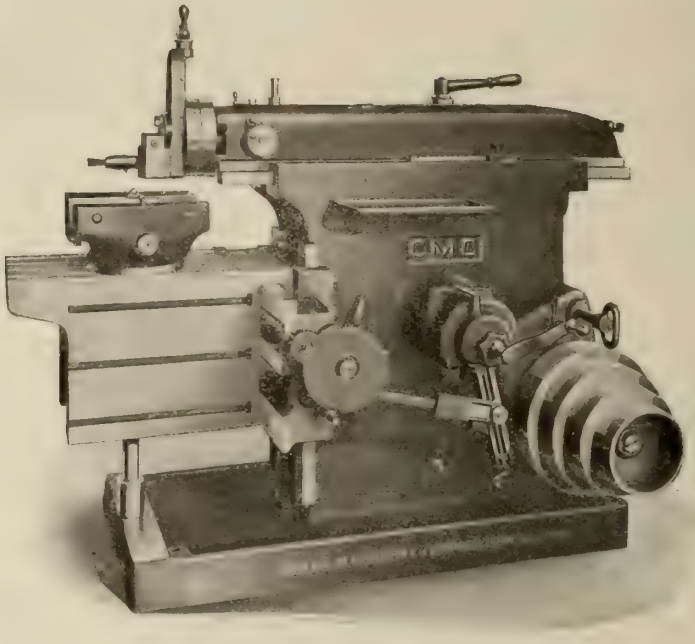
With this outfit you can drill ordinary sized holes, turn a pulley or piece of shaft, plane a casting, cut a slot or do a hundred and one jobs regularly met with in a day's work.



16 in. Lathe with Quick Change Gears



20 in. Power Feed Drill



20 in. x 22 in. Shaper

We manufacture also a complete line of heavier machine tools.

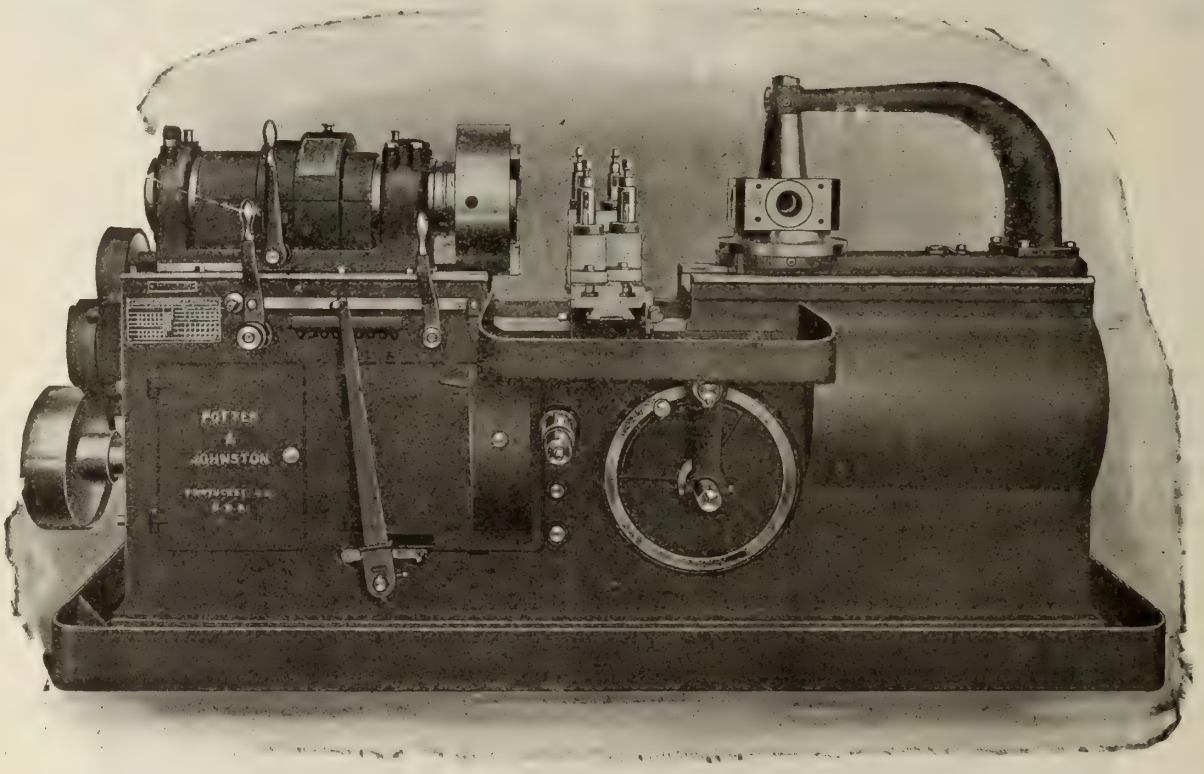
POTTER & JOHNSTON
MANUFACTURING AUTOMATICS
Increase the Output and Reduce the Cost



6-A Potter & Johnston Automatic Chucking and Turning Machine

6-A Potter & Johnston Automatic Chucking and Turning Machine

Geared head, having three automatic changes of spindle speeds.
Geared feed.
Auxiliary reaming and threading feed.
Cross slide.
Automatic back facer bar through spindle.
16-inch convertible two and three-jaw scroll chuck.
Spindle 5¾ inches diameter, hole 3½ inches diameter.

DO IT AUTOMATICALLY

All operations are entirely automatic. One attendant can readily run a battery of two to six machines.

In addition to automatically machining all varieties of castings from iron, bronze or steel, also forgings, the machines are also recommended and are widely used for finishing pieces from bar starch which have previously been cut off to length. This is a highly economical method of producing gear blanks, bushings, studs, etc.

Catalog gives full particulars. ***Drop a card for it.***

BETTS

16 Years of Faithful Service

The photograph below, taken in our own shops, shows a 22-ton cross planer bed casting being finish-planed on a Betts 120 x 72″ Planer. The depth of cut on roughing was ¾″ to 1½″, ⅛″ feed at a cutting speed of 28′ per minute.

This Betts Planer has been in active service 16 years, part of the time on 24-hour duty and continues to perform accurately and faithfully on a wide range of duties. Long life and faithful service are characteristic of all Betts tools because they are built to render service—not to sell at a price.

To avoid regrets—select a Betts. Send for detailed information concerning any or all Betts tools.

Less Overhead Expense

Whenever a strong, dependable hoist is needed, the "Imperial" air motor hoist fills the bill.

Few Parts Mean Less Trouble
The "Imperial" has few parts

The motor is completely balanced; the sensitive control allows the load to be raised or lowered a fraction of an inch at a time. Ball and roller bearings and thorough lubrication insure long wear.

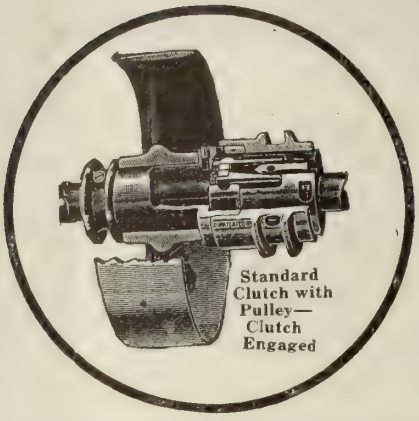
THE JOHNSON FRICTION CLUTCH

ON THE LEADING



Machine tools manufactured, is giving entire satisfaction. National Acme Co. say: "It will pull a heavy load. Very easy to shift. Fitted well into the plan of the machine."

Ford-Smith Machine Co. say: "The use of this clutch has speeded up the operation of finishing shells considerably and is standing up excellently under this heavy duty."

Cleveland Automatic Machine Co. said: "Service of this kind requires a friction clutch of correct design and the Johnson Friction Clutch proves entirely satisfactory."

How about clutches for YOUR machines; are you ready?

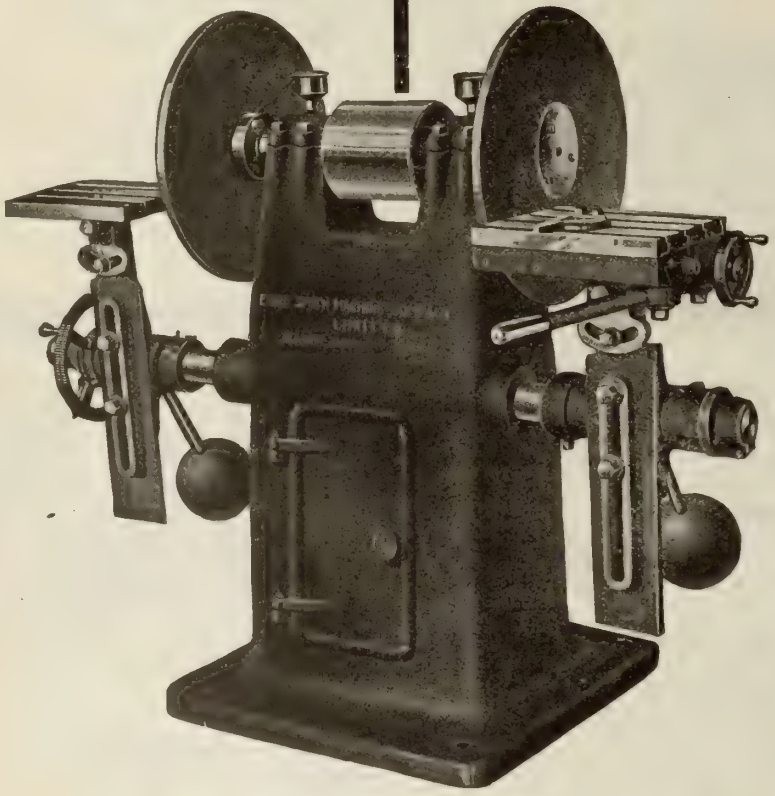
Water Tool Grinder

FORD-SMITH GRINDERS

General Purpose Grinder



20 Inch "Manufacturing" Disc Grinder

The use of Disc Grinding Machines for producing or finishing surfaces has grown rapidly wherever the method has been tried out.

As a manufacturing proposition, the Disc Grinder (or Ring Wheel Grinder for rougher work) has nothing approaching it for production. The abrasive materials on the Disc Circle are to be considered as extra-high-speed cutting tools. This, backed by ample belt power, and a heavy rigid frame, is the secret of the success of this method of metal reduction. These improved Machines will not slow down, glaze, or get dull, when correctly set up, even when the work is forced strongly against them.

Industrial Fatigue

Elaborate scientific tests have demonstrated that individual efficiency, both mental and physical, is highest and most enduring when the surrounding air is at a temperature of less than 70 deg. F.

The air in great shops and factories, as well as in offices, is often raised above the highest temperature at which the most efficient work can be done.

Nothing will aid ventilation and increase efficiency in poorly ventilated buildings so much as C.G.E. exhaust fans Why not investigate ? A card or phone message to our nearest sales branch is all that is necessary.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25%; a different method of molding them might double your production at no increase in molding cost. **We can advise you** and we have expert metal and wood pattern-makers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us.

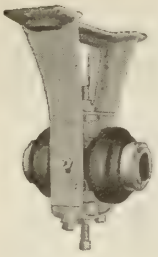
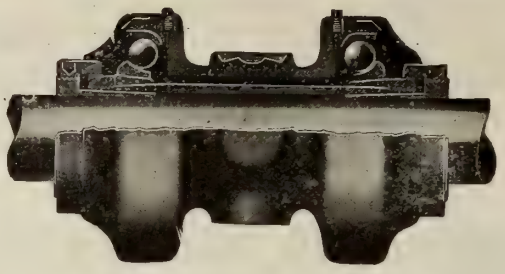
MADE IN CANADA



Friction Practically Eliminated



Lubrication required only once or twice a year

There's a Good Reason

When such firms as Pierce Arrow Motor Co., Ford Motor Co., Bethlehem Steel Co., International Harvester Co., Fairbanks-Morse Co., Goodyear Tire & Rubber Co., and 3,000 other plants installed **Chapman Ball Bearings** for their transmission machinery they did so for one good reason—because **Chapman Ball Bearings** eliminate friction and reduce power loss to a minimum.

The power saved by **Chapman Ball Bearings** will in two years' time pay for their installation.

Chapman Ball Bearings will fit into the hangers you have now—there is no necessity of going to the time and expense of new equipment.

Write for Catalog 3-B, which explains in detail the savings **Chapman Type Ball Bearings** will effect for you.

HŒFER

For Precision Drilling

For over 25 years the name Hoefer has been associated with drilling equipment. Drillers have been our specialty.

Hence it is only natural that Hoefer Drillers should embody the latest word in design, efficiency and accuracy.

And they do. Regardless of the size of press, drilling to a fine degree of precision is always possible.

Hoefer Drillers are looked upon as a recognized standard — the standard by which satisfactory service can be measured.

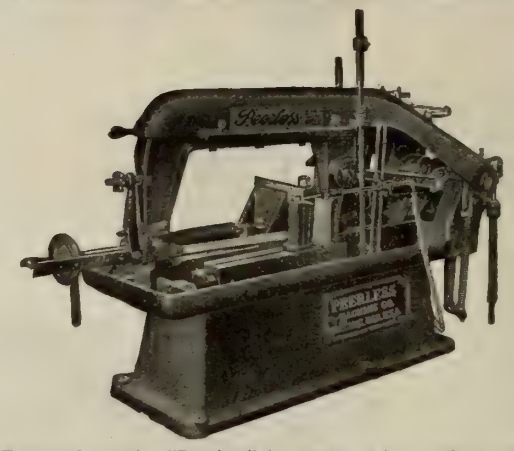
Peerless HIGH SPEED

Has Proven Its Efficiency Where Others Have Failed



DON'T turn down the "Peerless" because you have tried out other hack saws which did not answer your requirements.

Many concerns who were persuaded only with the greatest difficulty to try their first "Peerless," because they "just knew it would turn out like the others," are to-day among the largest and best-satisfied users of our High-Speed Saws.

The "Peerless" is different—and better. It does 50 to 100 per cent. more work, cuts with thinner saws and requires a minimum of attendance, saving time, labor, material, blades and floor space. What is your work? We can tell whether the "Peerless" will do it, and back our judgment with a 30-day trial. If it doesn't make good we pay freight both ways. Well?

A Heald Job on a Heald Grinder

The above photo was taken at the Heald plant where a Heald No. 75 Internal Grinder is grinding a hardened steel ball race to be used in the construction of a ball thrust bearing for the 12″ Surface Grinder.

Notice the radius truing device adaptable to either the No. 70 or No. 75 Internal Grinders, and which it is possible to either concave or convex the wheel as desired. In this case the curvature was 11/32 radius and a mirror finish was produced.

The Heald Internal Grinders, both hand feed and automatic, are not only production machines but are ideal for tool rooms, doing straight and taper work, large or small. The various size wheel heads are units in themselves and easily interchangeable.

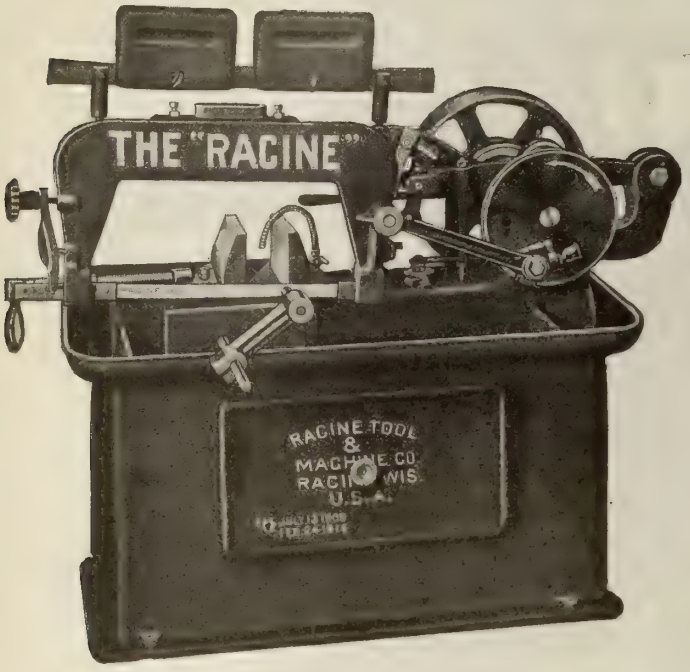
"THE RACINE"

HIGH SPEED METAL CUTTING MACHINE



Reduces Blade Expense

Aside from its ability to turn out more work than any other metal cutting machine, "THE RACINE" will save you considerable money on blades alone—enough to pay for itself in a reasonable time. The automatic lifting device is responsible for that. It automatically raises the blade on the return stroke, relieving it of all dragging or strain. This also means quicker cutting, less power used and greater production.

There are many ways "THE RACINE" will prove a big saving. Let us tell them to you.

Use "Racine" H.S. Tungsten Power Blades

Notes On Grinding

NORTON COMPANY WORCESTER, MASS.

No. 61A

From a Recent Discourse on Soft Wheels, by H. W. Dunbar

I have often had occasion in talking with some operator in a grinding department who felt that he was more or less in trouble because his wheel was wearing out rapidly or glazing and filling, and he could not produce the large number of pieces per day that he had hoped to, received in reply to my question, "Have you used a soft wheel?" the answer, "Oh, yes, this wheel is a K wheel." In his mind that wheel was soft because it occupied the position in the low scale of the grading list. He had given little thought to the fact that he was grinding work eight, ten or twelve inches in diameter. In each case the K wheel might have been quite a bit too hard for the operation, and again undoubtedly he had paid little attention to the fact that his speeds of work revolution could be of so great assistance to him in causing that wheel to act in a proper mannner.

When considering wheel grade to determine the correct one to use, the following points should be kept in mind.

1. That the grade letter has little meaning in so far as the wheel action is concerned, serving only as the means of identifying that particular wheel.
2. The diameter of the work will vary the cutting action of the wheel. The smaller the work the harder the wheel may be and the larger the work the softer it must be, of course, assuming that the diameter of the wheel is the same.
3. The larger the diameter of the wheel the harder the wheel will act. The smaller the diameter of the wheel, the softer it will act, the diameter of work remaining the same in both cases.
4. The wider the face of the wheel in contact with the work being ground, the softer the wheel must be to grind rapidly.
5. Work speeds are provided for the purpose of varying the cutting action of the wheel; in other words, so that the wheel may be made to act soft or hard.
6. The grain size affects the apparent grade of the wheel, finer grains appearing hard while coarse grains appear soft in their action, regardless of the bonding grade.

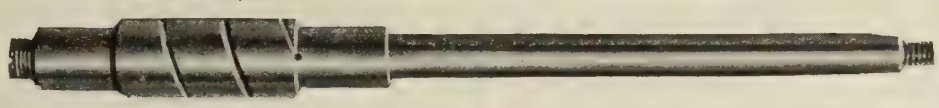
Five Diameters Ranging From 9-16 to 1 ¼ in. on Each Shaft--

with a Norton Grinding Machine

He Completes 45 Shafts Every 9 Hours



Every machinist should know what an amazing variety of cylindrical work can be ground on Norton Grinding Machines at less cost per unit than by any other method.

Here is an example in one of the big Middle West factories of a variety of diameters at low production cost. This operator grinds cold rolled steel shafts for water pumps in automobile engines. In the rough these shafts are in five sizes, running from approximately 9-16 in. to 1¼ in. in diameter; he removes about 0.020 in. stock to secure his diameters and is allowed a tolerance of 0.0005 in. The finish is perfect, yet he finish grinds 45 of these shafts every nine hours. Is there any other process that can compare with this—to say nothing of the high quality of the work?

If your shop does any cylindrical work you should get in touch with us at once. Our Service Department will cheerfully furnish information concerning the advantages of cylindrical grinding.

Write us to-day.

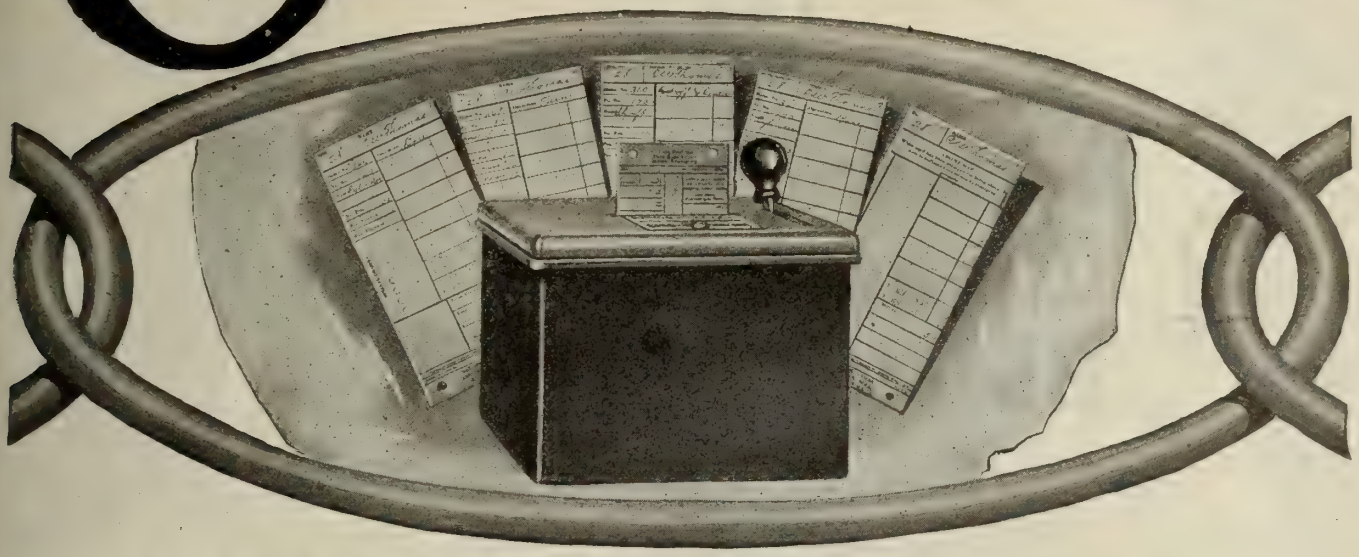
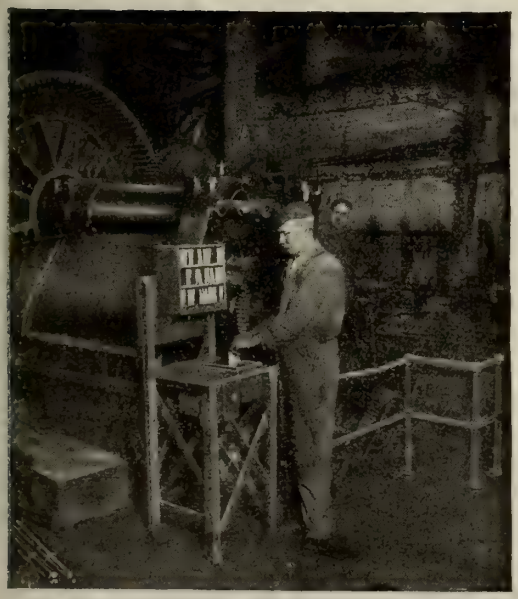
GISHOLT



A Vital Link in Securing Factory Control



The most important element of factory costs is labor. Record accurately every move of labor in your plant and you weld the master link.

Periodograph

gives you a true statement of what labor is doing. It produces business-like instead of haphazard records. It accounts for every fraction of working time, no matter how spent.

Look into the important part the Periodograph is ready to play in your factory in the matters of planning, producing and cost accounting.

GISHOLT MACHINE CO., 1207 East Washington Ave. MADISON, WIS., U. S. A.

Builders of Standard and Automatic Turret Lathes, Vertical and Horizontal Boring Mills, Tool Grinders, Small Tools, Special Machinery, etc.

Eastern Sales Office: 30 Church St., New York *Works:* Madison, Wis., Warren, Pa.

Periodograph Sales Agent for San Francisco, Calif., F. A. Thomas Co.

Yale Chain Blocks

"from hook to hook a line of Steel"—provides the strongest, quickest and easiest means of hoisting, no matter what kind of plant you operate.

The parts are few and simple, they have the greatest overload capacity, the chain is tested to two and a half times its capacity, the gears centre around one main shaft.

In short, the Yale is the most practical of all hoists.

No matter what kind of loads you have to handle—no matter what difficulties there are to be overcome, the Yale meets the contingency. Before you equip your plant, or replace old equipment, investigate the Yale.

Making Steel in Canada

CONSIDERING operation, and some of the reactions that occur in the furnace, with various elements described. The third of a series of articles.

IN OUR last article we described the construction of a blast furnace and some of its accessories. Now let us briefly consider operation and some of the changes or reactions that occur in the furnace.

The first step toward operation upon the completion of the furnace is to thoroughly dry out the brickwork. As previously described, all the joints between the firebrick are made with the thinnest possible layer of fire-clay, but there still remains a large amount of moisture to be driven off before the brickwork can be subjected to high temperature without cracking.

This drying out process of the furnace is accomplished by building small furnaces opposite the cinder notches for either wood or coal fires. Products of combustion pass up the furnace stack and out through one of the bleeders, which is left slightly open. The process is a lengthy one, anything from two to six weeks being occupied in properly drying out the brickwork; the temperature being gradually raised and gradually dropped.

When the cost of the lining is considered and the importance of a thorough drying out realized, it will be seen that this is a very important operation.

The stoves are dried out by kindling a wood or coke fire in the bottom of the combustion chamber. The temperatures in the stoves are only about one-third as high as the temperatures in the furnace, the same amount of time and care is not given to drying out the stove brickwork.

Starting up the furnace is known as "blowing-in." In the olden days blowing-in a furnace was usually attended with some ceremony, especially if the furnace was new and had been named after the owner's daughter or some such important personage. In these more matter-of-fact days blowing-in is simply a commercial operation, and instead of a ceremony, dinners and wine, careful check of the cost is kept.

Over the bottom of the hearth is spread a layer of fine coke dust. This serves as a bed upon which the first iron melted can fall, and prevents chilling. Cord wood placed on end is then charged into the hearth, and about one-half way up the bosh, some of the intervening spaces being filled with small kindling. Coke is then charged to a point two or three feet above the mantle and a little limestone mixed with it. The regular charging of the furnace now begins.

A charge is known as a "round," and consists of so much coke, ore and limestone. The ratio between the ore and the fuel is known as the "burden" of the furnace. In beginning operations the amount of fuel used is very much increased over the usual run of operations.

When the furnace is charged up to the stock line, the wood in the hearth is lighted through the tuyeres, and all openings and gas pipes to boilers and stoves closed tightly off. One or two of the bleeders at the top of the furnace are opened and the blowing engine started to operate at a very low speed. Smoke soon begins to appears out of the bleeders, and when it becomes sufficiently gassy it is lighted and allowed to burn. As operations continue the various gas mains are opened up, but great care is exercised to make sure that the gas drives out all air, otherwise an explosive mixture would result, which might cause serious damage.

In some plants steam connections are made and the gas lines filled with steam to drive out the air. A few hours after the furnace is lighted a light slag falls away, and after about ten hours a little iron will have accumulated in the hearth. This first iron is, of course, very often of a low grade, but indicates that the furnace is getting into its stride. Charging operations become more regular, and

after about three days iron can be tapped at regular intervals of four hours, but it is usually a month before the furnace obtains its full capacity.

In starting up the stoves, it is usual at first to use some of the early gas to bring all four up to a temperature of four to five hundred degrees. Then one stove is put on a light blast and the other three on their regular gas schedule. As operations continue, stoves must be cleaned at regular intervals, especially when the furnace is working on soft ores, and a large amount of dust is carried in the gas.

There are many difficulties that occur in the operation of a furnace, such as scaffolding, sticking or adhering of the stock to the walls of the furnace just above the mantle. This obstruction causes the uprising gases to pass with greater velocity through any free area, and the scouring action of the gases cuts deep channels in the brickwork. Severe cases of this kind have to be treated by inserting an extra tuyere at the seat of the trouble to cause intense heat to bring away the obstruction, or at times a charge of dynamite is resorted to. At other times break-outs occur with serious results. Tuyeres and cooling plates may be melted, or due to an error in charging, the stock may become chilled. In fact, a blast furnace superintendent has ever to be on the watch for some outward and visible sign that indicates some inward trouble.

Now let us consider what happens inside a furnace. Four things go into the furnace: iron ore, coke, limestone and air, and four things come out: iron, slag, gas and a little steam. How do the changes take place?

Let us take all the various ingredients, pull them to pieces, and see what they are made of:

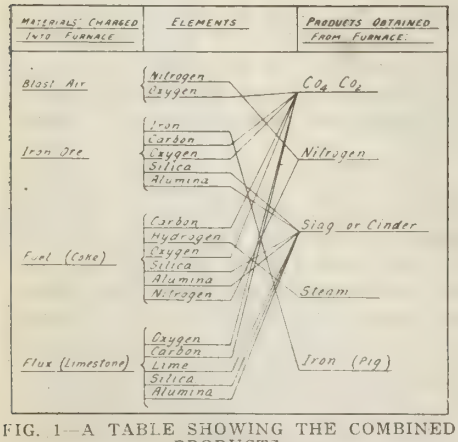

FIG. 1—A TABLE SHOWING THE COMBINED PRODUCTS.

Iron ore—iron, silica, carbon and oxygen.

Coke—Alumina, silica, carbon, nitrogen, hydrogen and oxygen.

Limestone.—Alumina, silica, lime, carbon and oxygen.

Air—Oxygen and nitrogen.

Iron—Iron, and many impurities in slight percentage.

Slag—Silica, alumina and lime.

Gas—Oxygen, carbon and nitrogen.

Steam—Oxygen and hydrogen.

Now look at Fig. 1 and see how they combine to form the products mentioned above.

Before going any further let us get acquainted with some of the gases mentioned.

First—Carbon Dioxide

When any substance rich in carbon burns in a plentiful supply of air, carbon dioxide is formed. The gas is colorless and has no smell; it is heavier than air, and is sometimes known as carbonic acid gas.

The chemical expression for this gas is $C + O_2 = CO_2$, or one part of carbon and two parts of oxygen. This gas will not burn and will not support combustion.

Second—Carbon Monoxide

The blue flame often observed burning on the surface of a coal fire is carbon monoxide gas. It is produced by carbon dioxide passing through the upper layers of heated coal, thus absorbing more carbon.

The chemical expression is CO, or one part of carbon and one part of oxygen. This gas is colorless, tasteless and odorless, is about the same weight as air, but if inhaled is an active poison.

The presence of this gas hanging around a furnace top is a source of great danger, and men are often overcome by the fumes.

Third—Hydrogen

This gas is lighter than air, burns with a pale blue flame, but will not support combustion. It is colorless and odorless, and when mixed with air it forms a highly explosive mixture.

The chemical expression is H.

Fourth—Oxygen

Oxygen has no taste, color, or smell, ordinary combustible substances burn more brightly in oxygen than air. This gas is indispensable to life, and is the part of the atmosphere which is used up in the process of combustion, decay and fermentation.

The chemical expression is O.

Oxygen combines with many things and forms oxides.

Fifth—Nitrogen

Roughly, the atmosphere contains eighty parts of nitrogen and twenty parts of oxygen. Nitrogen will not burn and does not support combustion, and, as may be expected from a gas forming so large a part of the atmosphere, it is without smell, taste, or color.

The chemical expression is N.

Now what happens in the furnace, hot air is blown in the tuyeres and meets hot coke; the oxygen in the air combines with the carbon in the coke and forms CO_2. This gas comes in contact with other portions of red hot coke and changes to $CO_2 + C = 2CO$, or carbon monoxide.

There is also some vapor in the air; the oxygen combines the carbon of the coke and leaves free hydrogen.

The nitrogen in the air blast remains to all intents and purposes unchanged.

This mass of gases rises upward with great pressure, and at a temperature varying from 2,200° Fahr. at the tuyeres to 400° Fahr. at the furnace top.

Starting at the top, let us see how the limestone and ore are influenced by these gases. At about twenty feet down from the top the limestone begins to crack and give off CO_2 gas; forty-five feet down it begins to soften and melt, uniting with the silica in the ore and the ash of the coke, the whole uniting to form a slag that floats on the iron, protecting it and forming a collecting blanket for impurities.

The iron ore begins to give up its oxygen at a lower temperature and increases in action as the temperature increases; deprived of the oxygen, the ore becomes a pasty mass, which melts upon reaching the bosh and drops in large drops into the hearth.

The above is a very simple expression of the changes that occur, stated without going into the necessary chemical expressions essential if a full explanation is desired.

The gases that are given off from the furnace top are roughly as follows:

Gas	By Weight	By Volume
Nitrogen (N)	52.59	54.51
Carbon monoxide (CO)	33.80	34.97
Carbon dioxide (CO_2) .	13.47	8.36
Hydrogen (H)	.14	2.16
	100	100

Part of the surplus or waste gases are used for heating the stoves as already mentioned. About 40 per cent. of the total gas generated is usually sufficient for this purpose, leaving 60 per cent. available for burning under boilers supplying steam for electric power and blowing engines.

Electric power, of course, is coming into greater use every day. Furnace bells that used to be raised either by steam, air, or hydraulic cylinders are now being electrically operated. Skip hoists that only a few years ago were always driven by steam engines are now being operated by electric motors.

Blowing engines are for the most part of the reciprocating vertical type, but already the turbo blower is entering the field, and on account of the vast saving in floor space, is fast superseding the more picturesque but less efficient vertical engine.

If the blast furnace is connected with the steel plant the product is usually conveyed in hot metal cars (see Fig. II) to the mixer in the open hearth department. If otherwise, the product is usually cast into pigs of a convenient size for handling. The casting of the pigs was at one time effected by making molds in the sand floor of the cast house. With the increased cost in labor, pig machines have come into use where the molds are attached to a moving chain. The chain passes underneath the pouring spout of a ladle, each mold is filled, passed down the chain into a tank of water, is cooled, comes out of the tank, and is discharged into a waiting car.

The disposal of the slag is quite a problem. When the plant is situated

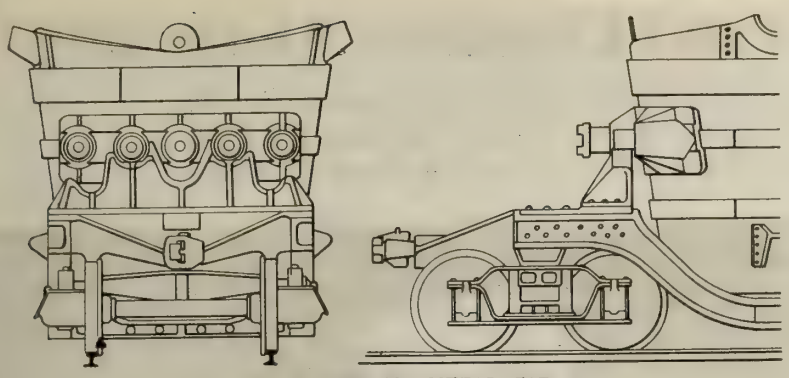

FIG. 2—THE HOT METAL CAR.

near a river or ocean shore the slag is poured into cars (see Fig. III) and dumped at the water's edge. If the plant is inland, great mountains are built up of the slag.

For a young country, Canada is fairly well supplied with blast furnace plants. The Dominion Iron and Steel Company, Limited, Sydney, N.S., have six furnaces, five having a capacity of 280 tons per day, and one having a capacity of 350 tons per day. The Nova Scotia Steel and Coal Company, Limited, Sydney, N.S., have two blast furnaces, one in operation and one under construction, each having a capacity of 250 tons per day. The Steel Company of Canada, Limited, Hamilton, Ontario, have two blast furnaces, one of 200 tons capacity per day and the other 300 tons per day. The Algoma Steel Company, Limited, Sault Ste. Marie, Ont., have three blast furnaces, two of 250 and one of 450 tons per day. Atikokan Iron Company, Limited, Port Arthur, Ont., have one blast furnace of 175 tons capacity per day. The Canadian Furnace Company, Port Colborne, Ont., have one furnace of 300 tons capacity per day. There are several other furnaces in the country, but mostly of small capacity or not in operation at the present time.

The product that we now have is iron, free from its earthly impurities, strong but brittle, possessing great compressive strength, but very little tensile strength.

We will next consider its cause of weakness and the way it is refined and the results of that refining.

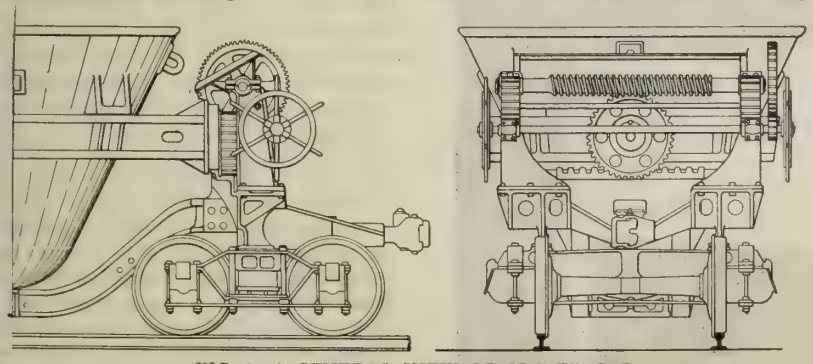

FIG. 3—A GENERAL VIEW OF CINDER CAR.

ACTIVITIES OF WELDING SOCIETY

One of the activities of the new American Welding Society is to be standardization. If any considerable progress is made in this one activity alone, the Society will have fulfilled a very high mission. While it is true that the underwriters' laboratories examination and registered label service has done much to keep up the general requirements on any acetylene consuming appliances, standardization on a scale possible and desirable in the acetylene industry would seem to be assured more readily by a bureau specializing in the one field in which we are most interested. Standardization in the automobile industry was laughed down 25 years ago, but no one factor has been more instrumental than standardization in the automobile industry's present state of development. If standardization was possible and successful in the automobile industry, it holds promise of equal benefits for the acetylene industry.

A NOVEL TACHOMETER

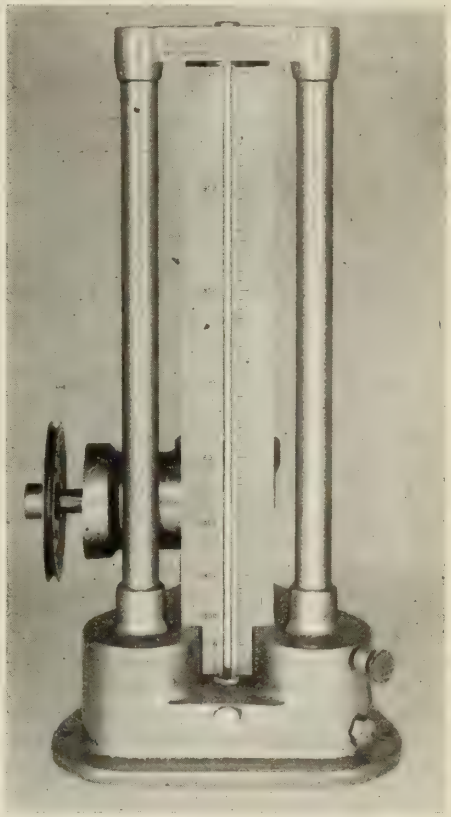
By FRANK C. PERKINS

THE accompanying illustration shows a unique speed indicator developed at Hartford, Conn. This tachometer is a permanently accurate instrument. It is a portable instrument for indicating revolutions per minute of dynamos, motors and shafting, and consists simply of a centrifugal pumps, a reservoir for liquid and an indicating tube. The only moving part is the paddle wheel in the centrifugal pump. This has radial blades and hence, indicates when run in either direction. When the paddle wheel is revolved, the liquid is forced out of pump and up the indicating tube by centrifugal force. The reservoir is connected by balanced openings to the centre of the pump and the liquid is discharged through balanced openings in its periphery.

It may be stated that the vertical height between the liquid in the reservoir and that in the indicating tube is approximately proportional to the square of the speed or revolution of the paddle. This makes the graduations open and easy to read at the upper part of the tube but too close for convenient reading at the bottom. Hence the scale is graduated only from the maximum down to about one-fifth the maximum. The graduations on the scale on front page represents variations of speed of one per cent. at top. A skilled observer can easily read the indications to within one-tenth of one per cent. at the top. Special scales with fine graduation can be furnished.

It will be seen that the reservoir is divided into 2 parts and the indicating tube is placed in the centre of gravity of the free surfaces of the liquid in the reservoir so that a slight inclination of the instrument does not appreciably vary its reading. The shaft of the paddle wheel is vertical so that no stuffing box is necessary and but a very slight amount of power is required to drive it. The paddle shaft is driven through a pair of bevel gears from a substantial horizontal shaft carried in ball bearings. The housing for this driving shaft can be rotated through more than 180° so that the instruments can be belted or geared from any direction. The vertical position of the paddle also serves to quickly eliminate any air bubbles which might be entrained in the liquid when the instrument is filled.

There is a displacement plunger provided for adjusting the level of the liquid to zero when it is at rest. There is a valve for throttling the passage from the pump to the indicating tube but this is used only when the speed varies suddenly. Kerosene colored with aniline dye is the liquid used.



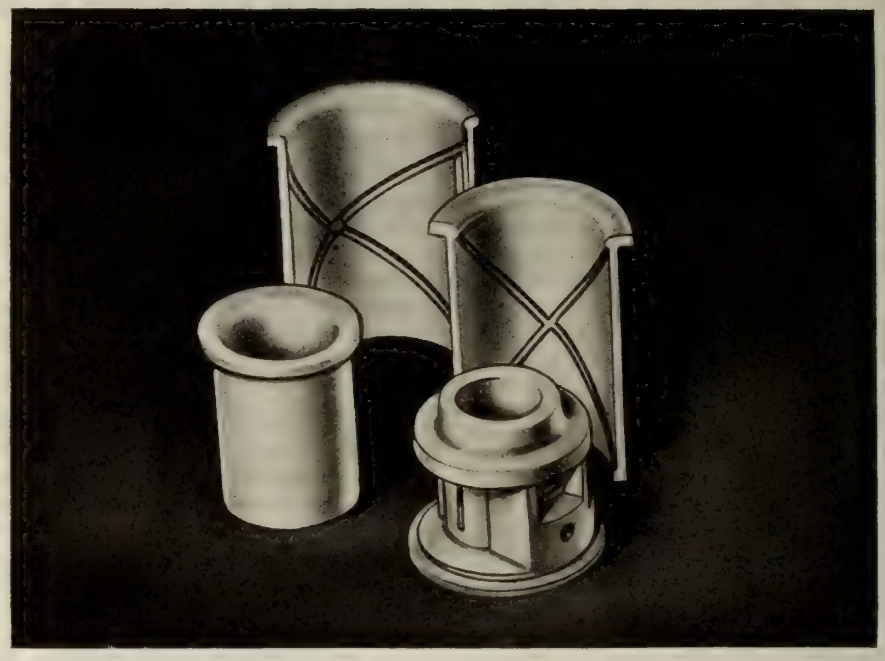
GENERAL APPEARANCE OF THE TACHOMETER

Use Die Castings and Eliminate Machining

Herein is Described From the Viewpoint of the Franklin Co., Why Die Castings Should be Used in the Design of Machinery to a Much Greater Extent Than They Are at the Present Time

THE manufacturing problems of Canada have changed greatly during the past few years. The need of rapid production in war materials has built up factories capable of large quantity production where before manufacturing was limited. Canada is today looking forward to a future that will mean still greater manufacturing achievement, and that will bring to the manufacturers of Canada a keener interest in everything which tends toward increased efficiency.

Among the many methods developed in the United States within the past 25 years, with a view toward improving large scale production, the process of "die-casting" has been widely accepted as a means of eliminating machining, and as such has gained steadily in favor. "Die-casting" is performed by forcing molten metal into steel molds under such pressure that after solidifying, its surfaces conform so minutely to the interior of the steel mould as to yield practically finished results. As a matter of fact there is usually less variation between two "die-castings" out of the same mould than between duplicate pieces machined by one and the same workman. Die-castings have long ago ceased to be of an unknown quantity. They have taken their recognized place with stampings, screw machine parts, forgings, etc., in the specifications for many well known products, among them automobiles and accessories, phonographs, electrical instruments, adding and billing machines, milking machines, cream separators, aeroplanes, motor boats and stationary engines. In fact, there are few lines of manufacture which have not found some use for die-castings.



AUTOMOBILE ENGINE BEARINGS DIE-CAST BY THE H. H. FRANKLIN MFG. CO.

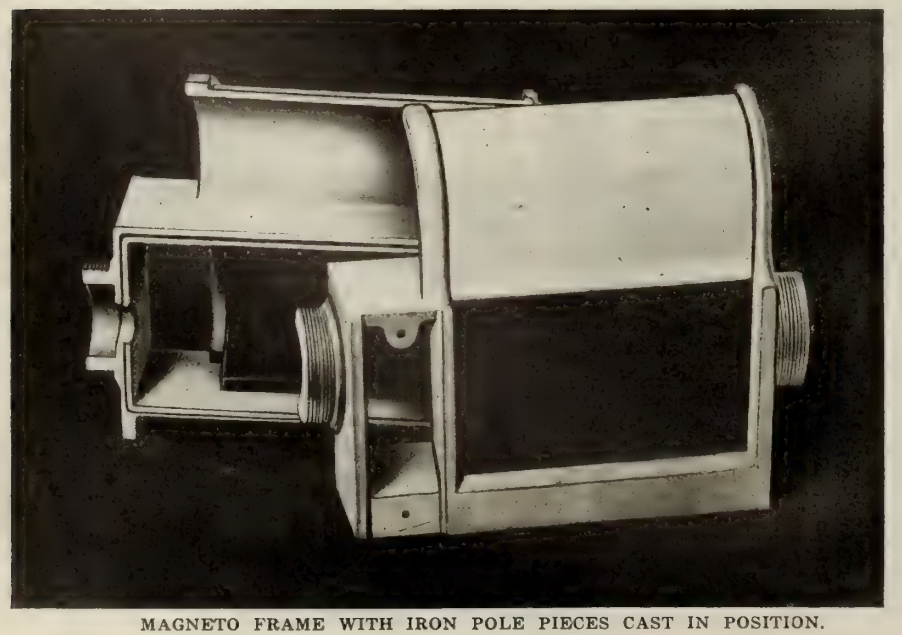
The H. H. Franklin Manufacturing Co. were the pioneers in the die-casting industry, Mr. Franklin having developed the process and having put it on a commercial basis as far back as 1892. In 1900 an exhibit of Franklin die-castings received recognition at the Paris Exposition, and by that time their advantages had been recognized by manufacturers of phonographs, telephones and other electrical instruments, cash registers and miscellaneous accounting devices. The castings were in those earlier days mostly small and made from low fusing alloys. But with the growth of the automobile industry came a marked advance in the production of die-castings. They were found of service not only for engine bearings but also in the framework for magnetos, lighting systems, oil, water and air pumps, engine governors and many other accessories.

The most recent recognition of die-castings has come through the world war, every die-casting firm being taxed to its utmost in the production of various parts carrying priority classification.

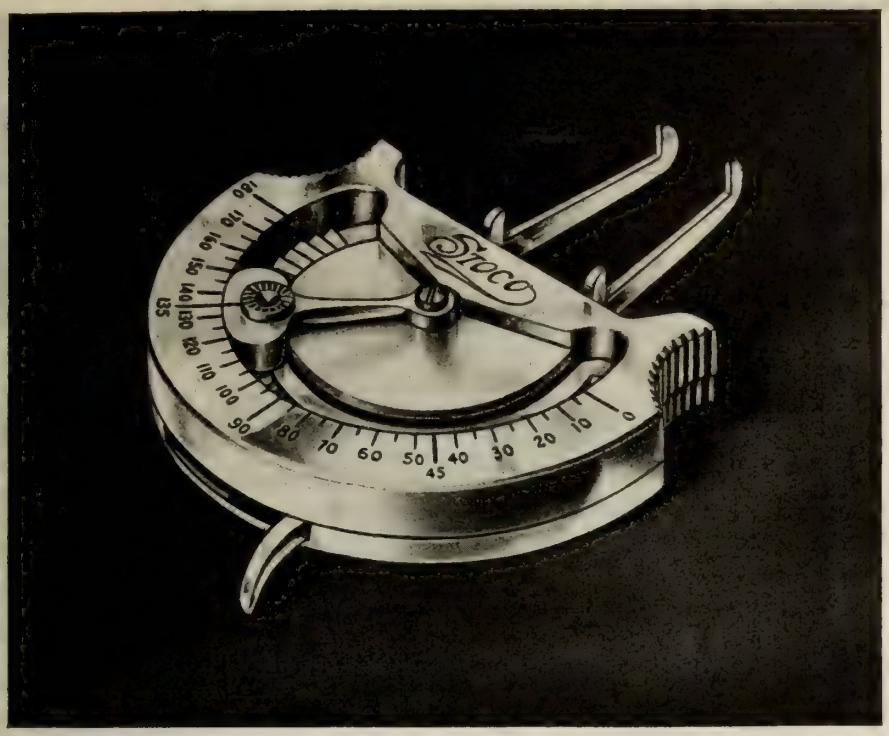
The addition of aluminum to the other alloys previously used made the die-casting process especially valuable in the production of small parts for aeroplanes, telescopes and binoculars, gas masks, bombs, machine guns, and numerous other devices where lightness was required. On the other hand, the standard die-casting alloys found ready use in the production of smoke bombs, hand grenades, shrapnel, truck governors, magnetos, lighting systems, and for the bearings in tractor and truck engines, and air compressors. Even drill stands, formerly considered as an advertising novelty, were recognized as important machine tools and given a high priority rating because of their wide use in shops doing Government work. The close of the war again releases to the general trade the various die-casting firms, all of them with organizations and methods more highly developed than ever before.

The metals most commonly used may be divided into the following groups:

(1) Aluminum alloys (usually the standard No. 12 aluminum, consisting of approximately 92 per cent. aluminum and 8 per cent. copper, and manufactured by the Aluminum Co. of America.)



MAGNETO FRAME WITH IRON POLE PIECES CAST IN POSITION.



OPTICAL INSTRUMENT MADE COMPLETE FROM FRANKLIN DIE-CASTINGS EXCEPT FOR SPRINGS AND SCREWS.

(2) The zinc base or white metal alloy sometimes incorrectly known as white brass. This is employed in the widest range of casting, the exact analysis varying with the requirements. As a general rule it compares most closely with cast iron as regards weight, strength and wearing qualities.

(3) Babbitts or tin base alloys. These are most commonly used in the production of high speed bearings or such parts as require great acid resisting qualities.

(4) Lead base metals chiefly employed in the production of slow speed bearings. During the war they were also commonly used in the production of shrapnel plugs and hand grenade parts.

The low fusing nature of most of the alloys as compared with brass or steel makes possible the introduction of pins, bushings or hardened blocks at points requiring special wearing qualities. This is of value, for example, in the manufacture of magneto frames where the iron pole pieces are accurately located in position when producing the die-cast frame.

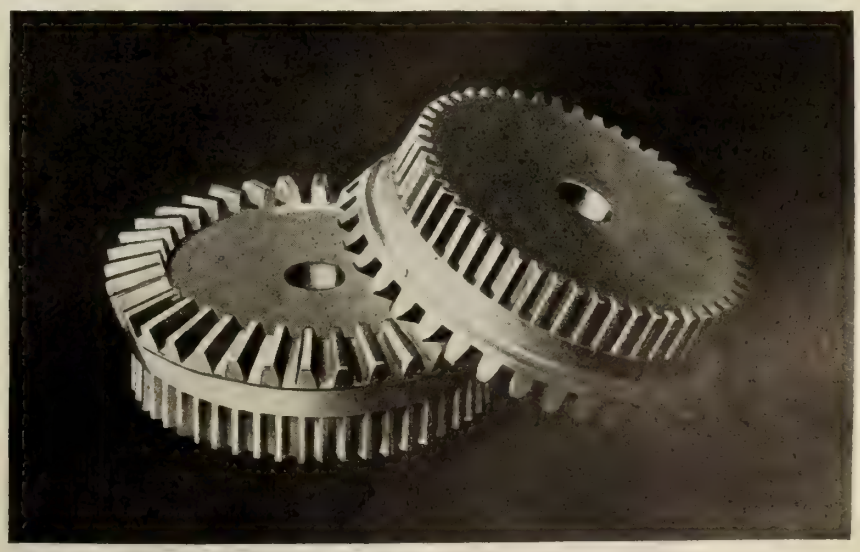
The dies used in the production of die-castings are of necessity expensive, and the process is not suited to small quantity production. This has somewhat restricted the use of the castings in Canada. But the change in manufacturing conditions due to increased quantity production is likely to revolutionize manufacturing methods during the next few years and result in an increased demand for these parts in Canada.

When planning to use die-cast parts there are certain general points, which, if borne in mind, will increase results in service obtained. (1) In dealing with steel cores, necessary in a process producing finished parts, undercuts or recesses in the interior wall of the casting should be avoided. In many cases it is, of course, possible to use collapsible or sand cores, but this increases the cost of both dies and castings. (2) A slight draft is in many parts desirable but not always necessary. (3) No allowance for shrinkage or machining need be made in making drawings except where excessive accuracy is required, or where a machining operation is required in order to true up an assembly. (4) It is cheaper to cast raised than depressed letters but both are practical. (5) Small filets added at sharp corners greatly strengthen the castings and increase the rate of production. (6) Where zinc or aluminum base alloys are used, the walls of the castings should be at least 1-16 to ⅛ of an inch thick, according to the size of the part, but when softer metals are used they can be still thinner. (7) Castings can be held to the accuracy of .001 in. to .003 in., according to the size and nature of the parts produced and the metal employed. (8) The best results are obtained in parts weighing under a pound in aluminum, and 2 or 3 pounds in the zinc base metal. Larger and heavier parts can often be produced satisfactorily. (9) Die-castings are not as a general rule made in competition with screw machine work, cheap stampings, or sand castings, which require little or no machine work.

THE STRENGTH OF FERRO-CONCRETE VESSELS

Owing to rumors of less satisfactory experiences with ferro-concrete vessels abroad, a Danish ferro-concrete shipbuilding company has asked the Director of the Norwegian Veritas for his opinion. It may be mentioned in this connection, that the Norwegian Veritas was the first institution of its kind to issue rules for the classification of sea-going ferro-concrete vessels and to classify such vessels. A fair number of ferro-concrete vessels and lighters have been built in Norway to Norwegian Veritas class, so that the institution has some experience with this method of construction. The director has now given expression to an opinion, which reads as follows: In the experience the Norwegian Veritas has had so far with regard to sea-going vessels of ferro-concrete, such vessels have proved themselves technically satisfactory, inasmuch as they have proved watertight and of sufficient strength. There have been no cracks which have caused leakage, and no trouble has been experienced in making the repairs necessary after collision or grounding.

Peterborough.—The contract for the Hunter Street high level bridge at Peterborough has again been awarded by the council to the Russell-Townsend Co., of Toronto. Of course, the by-law will be submitted to the council, and, as usual, might be revoked in the meantime. The Russell-Townsend's tender calls for $228,000, that is providing, of course, they do not build the steel arch.



COMPOUND SPUR AND BEVEL GEARS DIE-CAST BY H. H. FRANKLIN MFG. CO.

WELDING AND CUTTING

Various Jigs as Applied to the Welding Trade

Some Examples of Welding Jigs and Methods for Overcoming Distortion Are Taken Up by the Author, Who Presented This Paper Before the British Acetylene and Welding Association

By B. S. MILNE

(Continued from July 3rd issue.)

ANOTHER jig used for the manufacture of the same articles is shown in Fig. 16. In this case a boss "A" and stiffening cup "B" had to be welded to a hemisphere "C" at "B1" and "C1." Here again the hole in the boss had to be truly concentric with the axis of the sphere.

The hemisphere is supported on the casting "D," while the bottom edge is registered by ring "E." From the base of this casting spring two pillars "HH" supporting cross-bar "J," in which a hole is bored concentric with rings "D" and "E," through which passes pin "K" into the hole in boss "A," the pin being a nice sliding fit to the hole about two-thousandths less in diameter than the low limit of hole in boss. As the limit of the hole in "A" was only four-thousandths of an inch, the pin is always practically a fit to the hole in "A," and ensures that this must be concentric with the axis of the sphere. The pressure on pin "K," to hold the whole together during welding, is given by plate "L" and stud "M." This makes not only a very quick method of fixing and releasing, as about one turn of the nut will slacken plate "L," so that it can be turned out of the way while pin "K" is removed, but "L," being made of spring steel, while giving the required pressure, allows for expansion during welding.

This jig, like the last one described, is fixed on a pin at "O," at a convenient angle so as to turn easily during welding.

You will notice that the edge of the boss "A" is thinned to about the same thickness as cup "B," and the edge of cup "B" is thinned to about the thickness of the hemisphere, which greatly assists sound welding.

The hemispheres shown in the two preceding Figs. 14 and 15 had afterwards to be welded together and to be an exact overall length after welding.

As the welding already referred to caused slight shortenings and distortion, a cutting device was resorted to for cutting off the hemispheres to the correct length after the parts had been welded on. The hemispheres were left up to that time with rough edges as they came from the press. A diagram of this device or machine is shown in Fig. 17.

The cutting blowpipe is held in a swing arm "P" at an angle, so as to make a bevel cut which will give the necessary chamfer for welding. "Q" is a wheel which keeps the nozzle of the pipe always at the correct distance from the work. The work is attached to spindle "R." "S" is a fast and loose pulley,

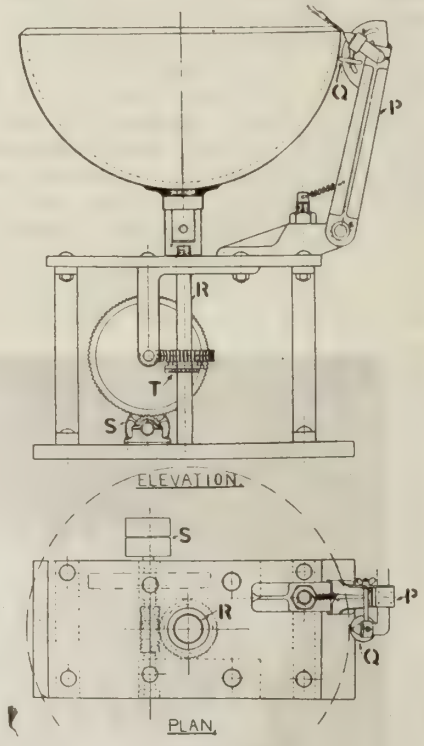


FIG. 17.

which is coupled to the line shaft in the shop with a belt. Spur and worm reduction gears bring the speed at which the work is revolved to the speed at which the blowpipe will do its work.

The blowpipe, which is an ordinary hand cutter, is lit and the work heated. As soon as the cutting jet of oxygen is opened, the belt is thrown over on to the fixed pulley, which starts the work revolving. The result is the well-known clean cut obtained with machine cutting devices.

In order to avoid the waste of time involved by slowly revolving the work a whole revolution, if a backfire occurred, or the cut failed at one part for any other reason, a ratchet device was fixed at "T" enabling the work to be quickly pulled round by hand.

Two further forms of joints in spherical work are shown in Figs. 18 and 21, both are for the same purpose, but the first gave rise to so many failures that the second was resorted to.

The test applied was 60 lbs. per sq. in. internal, and 200 lbs. external pressure. This puts a strain of 3 tons and 10 tons respectively on the weld, besides which the article, weighing some 7 cwt., was lifted by the cover on this flange. The snatch of a carelessly handled crane might put quite unknown stresses on it, but the design shown in Fig. 18 should stand this if properly welded.

Some causes of defects were:

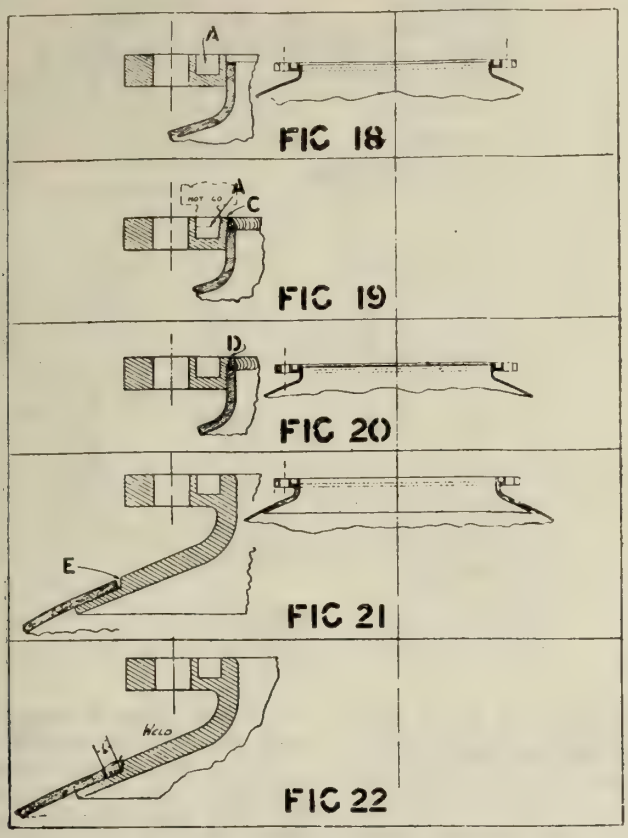
1. The groove A had to be correct to the hundredth part of an inch in width, depth and diameter, and the contraction, after welding, distorted the groove, as shown in Fig. 19, with the result that the Not Go gauge would enter and the fitter was obliged to hammer the inner edge back cold, putting severe strain on the weld.

2. The diameter frequently distorted oval, so that the diameter gauge would enter one way of the diameter and not on the other. This was corrected by cramping when cold and put a further strain on the weld.

3. Perhaps the greatest of all the causes of trouble was that one was supposed to keep ⅛ inch face at C, Fig. 19, consequently the welder, in fear of melting away the edge of the ring too much failed to make a weld at all.

Except where such fine limits are re-

quired in the groove, the design is, I think, fairly sound, and many of the failures were doubtless due to thoroughly defective welding. Anyhow, I was responsible for the welding of some 1,500



of these joints and had no complaint of defects after delivery, but I did slightly modify the design, as shown on Fig. 20.

By thickening the edge, as shown at D, Fig. 20, it can be freely melted without losing the face, and a better weld is made.

In the method of welding employed in Fig. 21, you will see that the hemisphere is shown lapped over the mouthpiece, which is a somewhat elaborate forging. The mouthpiece is machined at "E," to register into the hole in the hemisphere, with only 1-16 inch play. In a case of this kind, where one part is thick and one thin, this makes a very poor weld.

A concession was made allowing the hole in the hemisphere to be increased, and the joint was made as shown in Fig. 22, but this did not end the troubles. When the hemisphere was heated with the blowpipe, as might be expected, owing to its shape, it expanded outwards, and this not a matter of 1-32 inch or so, which would have been of no importance, but a matter of about ¼ inch. Even if clamped and tacked in six places, it lifted some 3-16 inch between tacks as welding proceeded.

Fig. 23 is a photograph of a section cut from one hemisphere which was clamped down in six places, by boiler screws, and shows the lift. On cooling, not only was the hemisphere distorted, but the bolt flange was buckled about ⅛ inch from the flat. A heavy cast iron ring was bolted on with six bolts, and a further attempt was made, but when the ring was removed the distortion, though reduced, was still about 1-16 inch.

Fig. 23a shows a photograph of two of the articles with the ring welded on after the difficulties had been overcome.

The jig shown in Fig. 24 shows how the difficulties were overcome. It consists of a base plate, A, on legs, with a spindle, B, at the centre, and three columns C, at the outside. The supporting ring, D, on legs, is merely used to hold up the mouthpiece until the heavy cast iron ring is bolted on to it. The heavy ring, E, drops on spindle, B, which holds it true with the base plate, A, and the correct height therefrom. The hemisphere is then dropped over and kept concentric with the mouth by four blocks, G, on the base plate. Over the columns, C, is dropped a ⅝ inch steel plate, H, with a chamfered hole at the centre, about ¾ inch larger in diameter than the hole in the hemisphere. This is tightly clamped down by the nuts on columns and prevents the hemisphere from rising off the mouthpiece.

The weld is completed while still clamped in the jig, when, by removing plate H and nut on spindle B, the hemisphere and mouthpiece can be removed with ring E still bolted on. The ring E is left on till cold. This almost entirely prevents distortion of the bolt flange of the mouthpieces from the flat. It was found that from nineteen to twenty-three thousandths of an inch shrinkage took place, in the diameter of the pitch circle of bolt holes and groove, and the diameter of the groove and holes had to be machined accordingly.

The plate H has the advantage of acting as a baffle plate, to keep the flame off any large surface of the hemisphere and also absorbs a large amount of heat from the hemisphere plate, thereby preventing the burning of the thin edge of the hemisphere, before the thicker mouthpiece is brought to welding temperature.

The execution of this weld had the effect of making the hemisphere shorten about 5-16 inch and distort slightly on the bottom edge. I had these machined at the bottom edge before putting on the mouthpiece, but, if I had to do this job again, I would resort to a cutting device like that already shown for a smaller hemisphere, as it is quicker and cheaper than machining and just as effective.

While I hold no brief for this design of joint, and do not consider it a good design, it certainly is an instance where suitable jigging made a most successful job of what at first appeared to be almost impossible. The reason being that, undoubtedly, the jig reduced the area of plate heated by the pipe, and, while using a certain amount of force to hold the work together, did not use it in such a way as to put great stress on the weld when the job was finished.

I have done nearly 1,000 of these hemispheres and hardly ever got even a pinhole, under test, and I have, on occasion, given the welds a severe hammering with a 7 lb. hammer before testing, without any ill effects.

Fig. 25 shows the jig in operation.

Fig. 26 shows a simple jig to overcome the ordinary welder's aversion to putting a thing on the right way round. This holds two lifting eyes in correct relation to each other.

One frequently meets with such work as that shown in the photograph, Fig. 27, namely light sheet metal covers, ⅛ inch thick, or less, welded to heavy flanges. This is always a difficult and somewhat unsatisfactory job to weld, but it is hard to see how to improve the design for welding without greatly increasing the cost of preparing the work. The difficulties are:

1. That the thin plate is overheated before the flange is brought to welding heat.

2. That welding along the inner edge causes shrinkage of this edge and consequent curvature of the flange.

A fairly satisfactory method of overcoming these difficulties is to heat along the outer edge of the flange with a larger blowpipe; this makes it possible to get a good weld without burning the thin plate, and to some extent counteracts the distortion, but even then some curvature takes place, and I have found it satisfactory to set straight flanges to a slight outward curve, before welding, and to make curved flanges of a somewhat larger radius. The amount of allowance to be made has to be found out by trial.

Everyone who has had to weld long longitudinal seams in sheet metal or plate, knows the difficulty of making the right allowance for the drawing together of the seam as welding proceeds, and also the difficulty of the edges of the

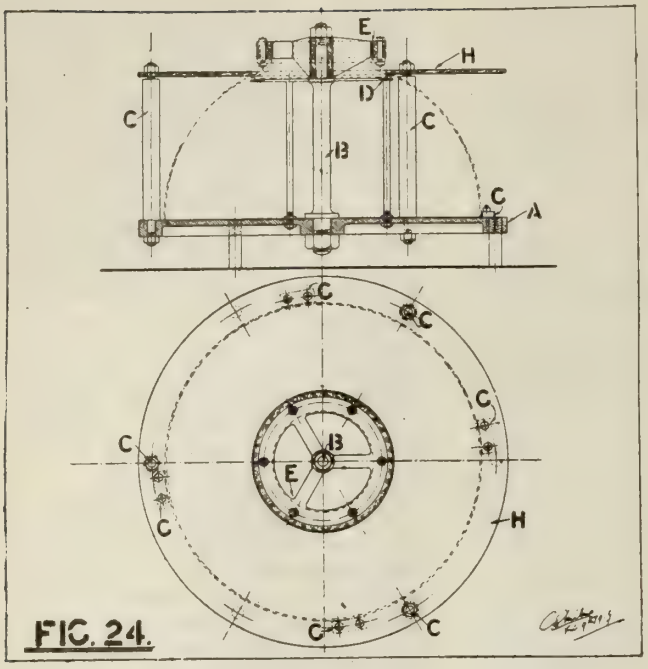


FIG. 24.

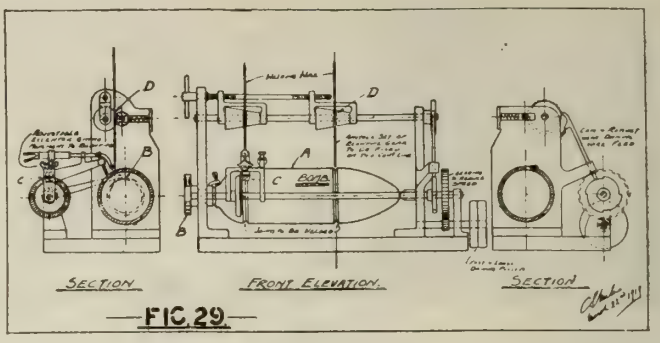

FIG. 29.

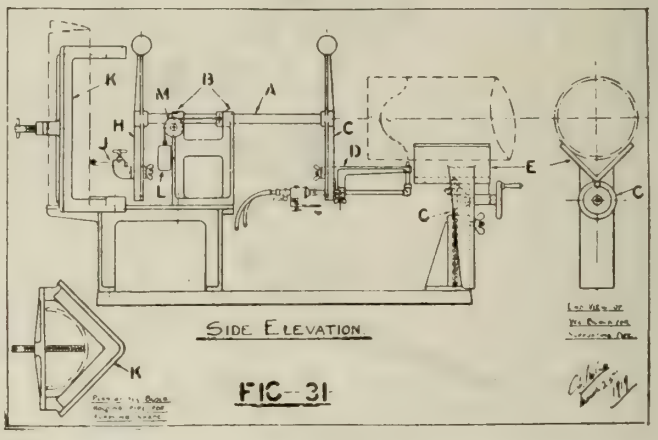

FIG. 31.

plate buckling, up or down, so that a perfect butt is not obtained.

Fig. 28 shows a very useful jig for overcoming this. It is a curved mandrel with a narrow hollow running down it. It is fitted with two clamps which can be swung aside to put the work in place, and afterwards tightened down by bolts at each end.

The joint comes over the hollow in the mandrel so that little heat is lost more quickly. When the clamps are sufficiently near the joint to keep it properly butted together.

The joint is left open the desired amount at the far end, and pulls together under the clamps. If it comes together too quickly the clamps can be tightened to restrain it, or, if the reverse, the clamps can be slightly loosened to allow the plate to come together more quickly. When the clamps are opened, as in the photograph, it makes a very useful mandrel for shaping up the work. I have these in various radii suitable for diameters from 5 inches up to 5 ft., and lengths up to 6 ft.

At one time during the war, the shortage of welders forced me to consider making an automatic welding machine, a matter which has been much neglected in this country. I was at the time considering the manufacture of 9½-inch trench mortar bombs, which were made of ⅜ inch plate. The bomb is shown at "A," Fig. 29. It struck me that the two circumferential seams might possibly be welded, both at the same time, by machine.

I made an experimental machine for the purpose, and several trial welds were made showing considerable promise, but, owing to the order for the bombs not maturing, it was never perfected. I am hoping shortly to continue my investigations.

A slight explanation of the lines on which I worked may, however, be of interest.

The machine was operated by a belt drive off the line shafting of the shop, and, through various gearing, turned the work, moved the blowpipe, and fed in the welding wire. The work was held in centres, and a ratchet "B" moved the work round, under the blowpipe, about 3-32 inch at regular intervals.

The blowpipe, through bevel gearing "C," was given a circular motion, making four revolutions to every forward movement of the work.

The wire was fed down into the weld by friction, between a V-shaped wheel "D" and cone-shaped roller, the object of the latter being to provide a variation of the rate of feed, by driving off the larger or smaller diameter on the cone. The cone was turned intermittently by a ratchet arrangement "E" which was adjustable.

The blowpipe was of the ordinary hand variety, but my experience led me to believe that a water cooled nozzle would be beneficial. The movement of the pipe was not altogether satisfactory, but with some modification I hope to be able to produce a serviceable machine.

Most of you are probably familiar with the type of cutting machine shown in Fig. 30, for cutting holes or circles in plates, and holes in tube, from 1½-inch diameter to 12-inch diameter. When cutting holes in a pipe, the blowpipe can be raised and lowered by means of the lever at the same time as it is turned. so that the nozzle can be kept at all times, the correct distance from the work.

I claim no novelty for this, but I do for that shown in Fig. 31. This is for cutting the ends of branch pipes to the correct form for fitting on to the main pipe.

It is a laborious business to set out on a drawing board the profile of branch pipes, and, when a template has been made and the line marked on the pipe, it is still difficult to cut accurately to the mark. This machine, however, does the work automatically for any size branch pipe, up to 12-inch diameter, to fit any size main pipe, up to 12-inch diameter.

The method of operating is as follows:

"A" is a shaft which can turn and slide in bearings "B." The slide "C," keyed to this shaft, has a carrier "D" for cutting blowpipe. This carrier can be set at any desired distance from the centre of shaft "A."

The Vee block "E" carries the pipe which is to be cut, and can be raised and lowered, by means of screw and gear "G," so that, whatever the size of the pipe to be cut, it can be set concentric with the shaft "A."

The other end of the shaft "A" has got keyed to it a slide "H," fitted with a carrier for a former wheel "J," which can also be set at any desired distance from the centre of shaft "A."

"K" is a Vee block in which a short length of pipe can be clamped vertically.

If, for example, a 6-inch branch pipe has to be fitted to a 9-inch main, a piece of 9-inch pipe must be clamped in Vee block "K," and a piece of 6-inch pipe put on Vee block 'E," which latter is then set concentric with shaft "A" and the cutting blowpipe set so that the nozzle is about ¼-inch from the outside of the pipe.

The former wheel "J" is set by the scale on slide "H" to 3-inch radius (i.e., half the diameter of the pipe to be cut).

Now as shaft "A" can slide, as well as turn, and as it is attached to weight "L," by a wire running over a pulley "M," the former wheel "J" will be kept on to the pipe in Vee block "K," so that

when the shaft is revolved the blowpipe takes not only the circumferential movement but also the longitudinal movement imparted by the wheel "J," running on the curve of the pipe.

According to the size of the pipe, and radius on which the wheel "J" runs, the shape of the cut made by the blowpipe will vary.

Fig. 32 shows a cutting blowpipe guide which is particularly useful for bevelling the edges of plates, to prepare them for welding. For this purpose one wheel is flanged to run over the edge of the plate. It is also useful for many other purposes.

Fig. 33 is practically a radial drilling machine with the cutting blowpipe as a drill. By the combination of the three cones belt drive, and the special drive in the head, infinite variety of speed,

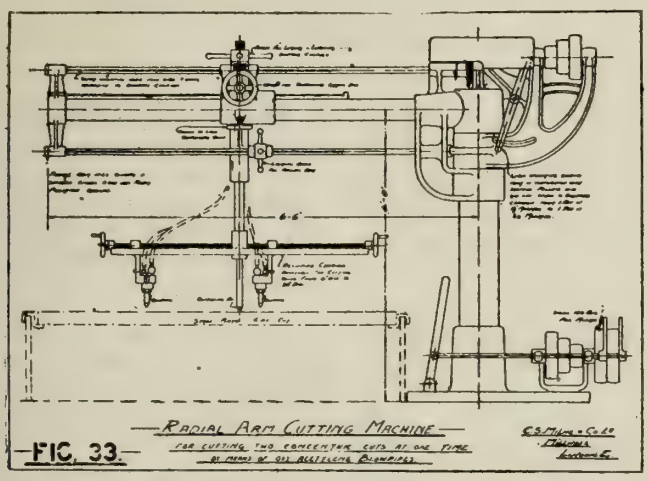

FIG. 33.—RADIAL ARM CUTTING MACHINE—FOR CUTTING TWO CONCENTRIC CUTS AT ONE TIME BY MEANS OF OXY-ACETYLENE BLOWPIPES.

between one revolution in 1½ minutes and one revolution in 24 minutes can be obtained, and the speed can be varied by means of the lever while the machine is running.

It was designed for cutting flanges from plate 2 inches thick and upwards. It is fitted with two cutting heads to cut the inside and outside of the flange at one time. Provided the difference in radii is not too great, the slight loss of oxygen, from one cut not being made at its greatest speed, is more than compensated for by the time saved.

To revert to the subject of welding for a few moments, I should like to show one or two pictures of repair work in the process of execution.

In the case of repair work, and particularly of cast iron repairs, I am a great believer in charcoal fires for heating in order to reduce cooling stresses.

My objections to the muffle furnace are:

1. That, unless one specializes in one particular class of work, the jobs vary so much in size that frequently one cannot get them into a muffle.
2. That frequently it is neither useful nor advisable to heat the whole casting.
3. To my mind the most serious objection is that, as the work has to be drawn out of the muffle to be welded, the body of the casting is cooling just at the moment when the part being welded is being made hotter.

Now with the charcoal fire the opposite takes place because the job can be welded while in the fire, and the draught set up by the blowpipe flame tends to fan the surrounding charcoal to a greater heat, thus evening up the heat on the surrounding casting.

If the casting is a large one, and only part of it wants to be heated (Fig. 34), the fire can be built round the part to be heated and, if desired, this fire can be moved with the casting, so that the work on all parts can be done in the most desirable position. Figs. 34, 35 and 36 show this.

The fracture being welded was the equivalent of a break, through "AA," in both sides of the frame, Fig. 34. It was lined up and clamped together and a sheet metal firebox was welded together round it. After the part which could be got at had been welded, it was turned on its side and the work continued as in Fig. 35, the box full of red hot charcoal going with it. It was then raised on its ends, as shown in Fig. 36, and completed.

In this way no chilling takes place during welding, and the weld can be done in the most favorable position. I personally have very little faith in vertical welding on cast iron, though in steel perfect work can be done, consequently I like to be able to turn the casting so as to work always on the flat.

Another example of partial heating is shown in Fig. 37. This wheel had to transmit 240 h.p. and, since the repair was made has been working for several years.

Possibly one or two lantern slides of other work may be of interest, if time permits, although this completes my "Examples of Jigs and Methods for Overcoming Distortion."

Company Gives Playground:—The Dominion Coal Company of Sydney, N.S., have donated a plot of ground to the city, which is to be used as a playground in summer, and an open-air rink in winter for the children of the district.

THE AUTOMOBILE TORPEDO

By M. E.

In 1868, the invention of the automobile torpedo by the English engineer, Whitehead, of Fiume, solved the problem of the submarine offensive in the most sudden and conclusive maner. Whitehead's success arose out of the failure of an enterprising Austrian officer, Captain Lupuis, who had been trying to steer a small fireship along the surface of the water by means of a rope from a fixed base either on shore or in a parent ship. The plan was a crude one, and was rejected by the Austrian naval authorities; it was then entrusted to Whitehead, who found it incapable of any practical realization. He was, however, impressed with Lupuis' beliefs in the value of a weapon which could be operated from a distance, and, though he failed in designing a controllable vessel, he conceived instead the idea of an automobile torpedo, and after two years' work, constructed it in a practical form. It has been spoken of as "the only invention that was perfect when devised," and it certainly came very near perfection at the first attempt; but it was erratic, and could not be made to keep its depth. In 1868, however, Whitehead invented the "balance chamber," which remedied these defects. The automobile torpedo was at first used only for the armament of ordinary warships; it was not until 1879 that an American engineer named Mortensen designed a submarine with a torpedo-tube in her bows. His example was followed by Berkeley and Hotchkiss in 1880, by Garret in his first Nordenfelt boat of 1881, and by Woodhouse and by Lagane in the same year. Even after this, Drzewiecke, Tuck and D'Allest designed their submarines without torpedo-tubes; but these were, in fact, indispensable, and the use of the Whitehead torpedo has been, for the last twenty years, assumed as the main function of all submarines designed for war.

HEAT TREATMENT OF STEEL

In a paper on the "Heat Treatment of Steel," read before the Society of Engineers, Mr. C. O. Bannister gives the following extracts from a book on trade secrets published in this country in 1583. "Take snayles and first drawn water of a red die, of which water, being taken in the first month of harvest when it raynes, boil it with the snayles, then heat your iron red-hot and quench it therein and it shall be as hard as steel. Ye may do the like with the blood of a man of XXX years of age and of a sanguine complexion, being of a merry nature and pleasant." Quenching mediums such as these were used for centuries, and in a book published as late as 1810 the worker was told to "take the roots of lilies, infuse it in wine and quench the steel in it, and the steel will be hard;" on the other hand, he was told that if he "takes the juice or water of common beans and quenches iron or steel in it, it will be as soft as lead."

WHAT OUR READERS THINK AND DO

We Start a Discussion on Another Subject

This Time It is a Reader Who Sends Us His Views on Parting Tools, Which We Believe Will Not Coincide With Those of All the readers of "Canadian Machinery"

DO you like a discussion? Following this introduction, so to speak, we are publishing a talk on parting tools, which we submit to readers for discussion. As to our attitude in the matter, we say absolutely nothing—for the present, but afford readers the first chance to comment on the authors' views. After everyone interested has had their fling, we shall perhaps speak on the subject, except in the meantime some other correspondent voices our sentiments. This article is published without a change to the author's manuscript.

Now since we have cleared up our reason for publishing this article, let us hear from the author himself.

A TALK ON PARTING TOOLS

By Wm. Ernest

Who has not at some time or other seen or experienced the provocations peculiar to parting tools? The most peculiar thing in connection with parting off stock, is that the poor old lathe nearly always gets blamed. If it isn't a loose spindle it's a rackety, old compound rest, or probably a loose gib in the cross slide that is considered to be the cause of poor results.

Well, to make the whole story plain, let us first consider the ordinary forged parting tool. In the opinion of most mechanics this is the best style of cutting off tool. However this may even become very troublesome if the proper clearances are not obtained. A good blacksmith will draw one out so that very little grinding is required, but often too much is taken for granted that because a tool looks right, it must work right.

Now if the clearances are just right, but the bottom of the tool is bevelled off to a slight degree, it will be seen that the screw in the tool post will draw it down to that level and consequently tilt over the under side of the tool, thus causing it to drag and chatter and dig in. Thus, it will readily be seen that the bottom must be horizontal, with the clearance equal each side: then if the cutting edge is wider than the back of the tool, and the front clearance not too much, even if the lathe spindle and other circumstances are rather unfavorable, once the tool is thrust into the work, and all slackness is taken up, the tool will peel cut nice shavings that make work pleasurable. To sum up briefly, "always see to it that the groove cut is lots wider than all except the extreme cutting edge."

The next tool to consider is the popular Armstrong parting tool holder with the blades held by a clamping screw. These tools have a bad habit of breaking, on account of not cutting their way clear. The makers claim that the good feature of this tool is that, when it breaks it is only the work of a minute to regrind and thus avoid delay. To my mind this is poor consolation, and to eliminate this tendency to break, I usually adopt the following method: First of all we know that the groove to be cut MUST be wider than the tool, therefore, an Armstrong parting tool must be widened slightly at the cutting point. It will be noticed that the blades are just soft enough to peen up if an ordinary hammer is used. I therefore tap the edge slightly and feel the increase in width between the thumb and finger. After this the edge must be touched up on an emery wheel and it is really surprising what a difference that few thousandths extra width makes.

In the operation of these tools; however, it will even be better to let the blacksmith upset the end slightly and then reharden. This extra trouble is well worth the while, for it will be found that a tool will work for a long time this way, and breakage is also reduced to practically nil. Finally, I would say that this is the only way that I would ever consider using the removable type of parting tool, and I would be very much interested to hear what luck others have with these tools.

What have you to say on this subject? Let us hear your views on the art of parting tools. All articles which we deem worthy of publication will be paid for at our regular rates, so get busy.

SPECIAL COMBINATION TOOL

Continued from July 3rd issue

By Robert Mawson

THE tool here described is used to overcome what was once a long and tedious machining operation, in fact a series of operations. This is the machining of a step for the spindle on a special machine. The manner in which this was formerly done was to first drill the hole to a predetermined depth, then turn the outside, afterwards face the end and machine a circular contour at the extreme outer end. It can readily be seen that when performing these operations singly there were many chances of error as each were independent of the other, not being controlled by any previously machined surface.

In the drawing is shown the casting and the special tool here described assembled. The work performed is drilling the hole A, facing the outside B and turning the concave surface C.

It will be noticed that two sizes of holes are to be drilled in the piece, which makes the operation more difficult. On the first tool made the drill was designed solid as shown by the detail D. It will be seen that this is made from a piece of high-speed steel with the end turned down to the correct length and diameter.

The trouble with this design is that there is no provision for either adjusting the position or length which is turned down after the end of the drill has been ground.

The new design E was therefore made to overcome these objections. This is made from two pieces of steel, one a stock drill .465 in diameter, which was slid into a reamed hole the same size in the body of the tool, which is .6875 in outside diameter. At the rear end of the drill is a tapped hole ¼ by 20 threads, and a headless set-screw is provided so that as the cutting edge of the drill is ground the inserted drill may be forced out by means of the screw to retain the .375 in. dimension. The tool was made with a concave groove on opposite

sides and a keyway machined at 45 deg. headless screw, one inch long, inserted in the shank.

The hollow mill used for the facing operation is shown at F. It will be seen that this element is made with three cutting teeth, and the back end counterbored and reamed to 1⅛ inch. Three holes are drilled and tapped at the counterbored end, one for a ¼ inch 20 thread screw, and two of ⅜ inch 16 thread screws. A detail of the extension sleeve is illustrated at G. The element is turned down at one end to 1⅛ inch for a distance of 63 sixty-fourths of an inch, and a hole drilled and reamed to eleven-sixteenths of an inch for a length of 3 and three-sixteenths of an inch. The rear end is drilled and tapped for ⅜ inch 16 threads set-screw.

By referring to the side view it will be noticed that a slot is machined on one side for a distance of 1½ inch. There is also a No. 11 hole drilled, and a tapped hole ¼ inch 20 threads, these last two holes being 13 thirty-seconds of an inch off centre. The tool for forming the concave surface is shown at H.

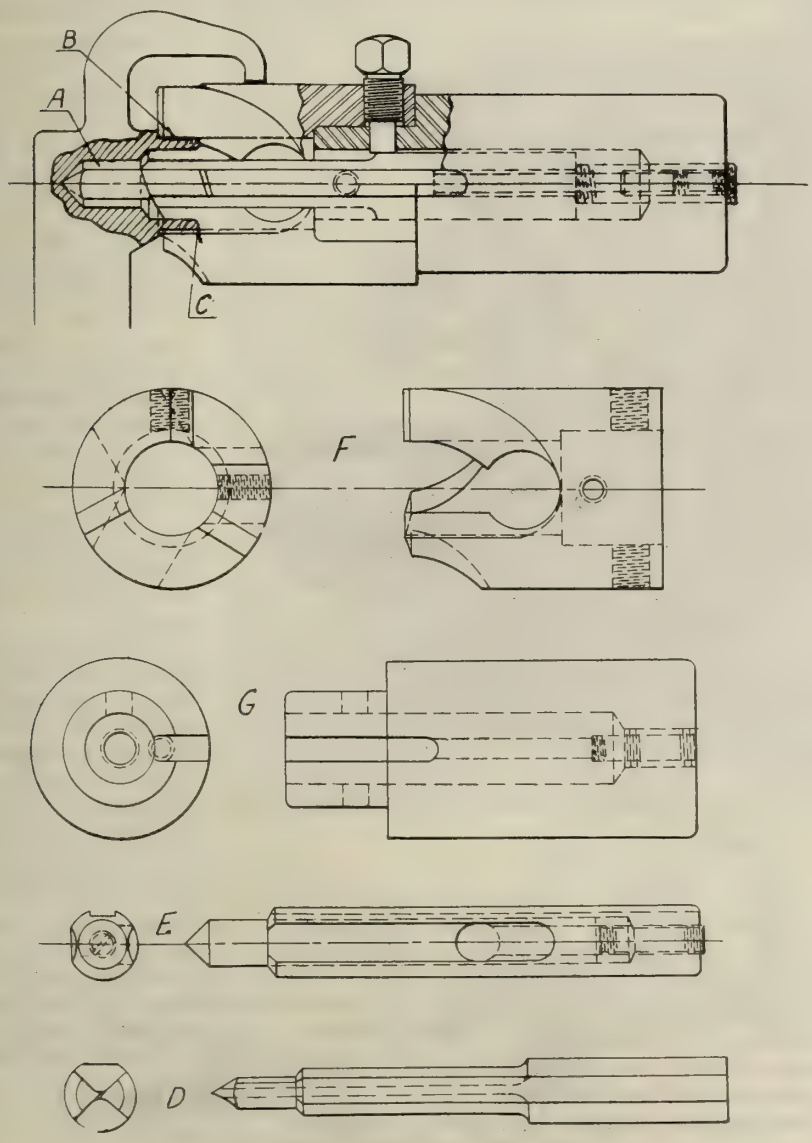
It will be noticed that this element is made of square high-speed steel, the cutting end being machined with the correct contour and clearance or rate ground on it.

When assembling the tool the drill E is placed in the extension G. The cutter H is then placed in the slot of the extension sleeve. The hollow mill F is afterwards placed over the extension sleeve.

The screw V is then screwed into the threaded hole of the hollow mill, the turned end fitting into one of the holes in the sleeve. An iron rod K, five-sixteenths of an inch diameter, and 2 and five-sixteenths inch long, is placed into the No. 11 drilled hole in the extension. A ¼ inch headless setscrew is placed at the rear of this rod and a ⅜ inch set-screw in the other tapped hole in the extension sleeve. A ¼ inch set-screw is also placed in the ¼ inch by 20 thread tapped hole in the hollow mill.

The tool is now ready for operation. The purpose of the two headless screws in the rear of the extension sleeve are for adjusting the drill and concave tools. The headless set-screw through the hollow mill is to hold securely the concave tool after it has been properly adjusted.

The ⅜ inch square-headed set-screw through the hollow mill and sleeve not only hold these parts together but it will be noticed that the turned end comes against the drill, thus holding that element in position after it has been adjusted for position with the headless set-screw at the rear end. The grooves on the drill are for chip clearance, allowing them to pass away from the casting being machined and enabling more rapid and better results to be obtained. Some of the principles shown in this tool may be no doubt used for other pieces as this combination tool has proved a great success in operation, the pieces being machined being not only interchangeable but produced at a much more rapid rate than was ever possible by single operations under the best conditions. A further advantage is that a cheaper class of workman can be employed to use the tool as measuring and checking for each separate operation is avoided.



VARIOUS DETAILS OF THE TOOL.

TO SHARPEN THE THREADS OF A SOLID DIE

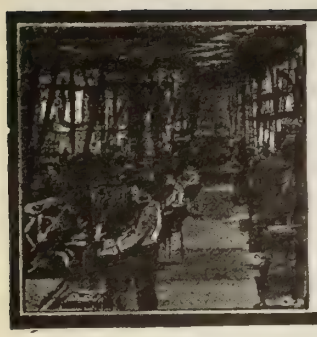
By H. J.

Solid dies are difficult to sharpen, because of the fact that the grinding wheel will not enter the cutting edges. If the dies are small they can be sharpened with a lap made of lead or wood, which is charged with emery. The lap can be revolved in the lathe, and the die worked back and forth on the lap. The proper angle will be ground, if the lap is a trifle smaller than the hole.

Selenium, an element analogous in some of its properties to sulphur which is obtained during the smelting and refining of copper, has had but little industrial application. Mr. H. A. Gardner, of the Paint Manufacturers' Association of the United States, has, however, prepared several pigments from it—the selenites of lead and borium, for instance—which are very white and of fine grain. Their exceptionally high refractive index gives them intense opacity. Other pigments of a closely related nature may be produced from beryllium. The oxide and similar products of zirconium have a very light degree of whiteness, opacity and permanence. From titanium many compounds have been produced, and it is probable that some day they may be used as pigments where great opacity and permanence are desired.

According to some investigations made in America on the best kinds of glasses for shielding the eyes of men working at furnaces, for protection from ultra-violet light, black, amber, green, greenish-yellow, and red glasses are efficient. Against the intra-red rays, deep black, yellowish-green, sage-green, bluish-green, and gold-plated glasses are best.

The Hudson Bay Railway.—At the recent session of parliament a sum of $300,000 was voted for the purposes of Hudson Bay railway construction. A further amount of $10,000,000 was passed for the government shipbuilding programme.



DEVELOPMENTS IN SHOP EQUIPMENT

HEALD ROTARY SURFACE GRINDING MACHINE

THE 8 in. or No. 20 and 12 in. or No. 22 Rotary Surface Grinding Machines have been designed for manufacturing purposes and at the same time will give an extremely fine finish. They have been built massive, yet simple, having all the necessary mechanical refinements required to readily get various speeds and adjustments.

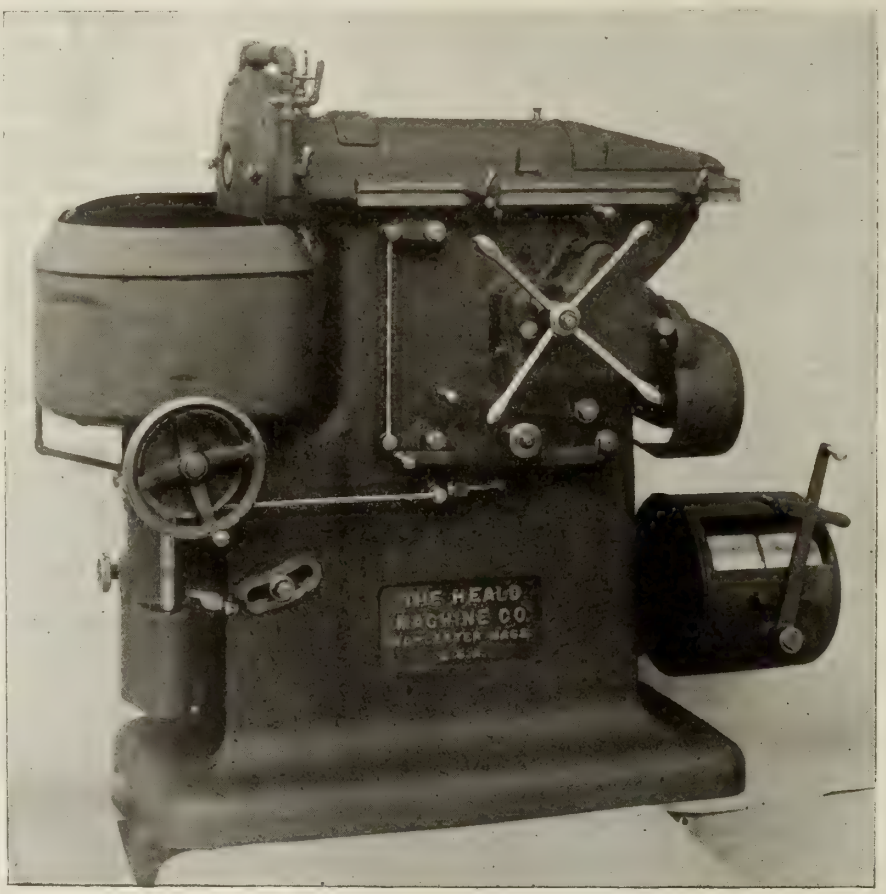
The wheel slide is a massive casting, having a flat and "V" way, which assures alignment at all times. The bearing surfaces are large and carefully protected from grit and dirt. Experience has proven that a downward pull of the spindle belt adds greatly to the rigidity and has been incorporated into the design of these machines.

The wheel guard is made separate from the wheel slide. It is not put on, however, in the usual manner, as it has the back face finished off to fit a finished surface on the wheel slide, making the two parts practically one. The advantage of this design is that if a customer should for any reason desire to use a larger wheel he will be able to do so.

The wheel spindle is large in diameter and made of chrome nickel steel. It is mounted in a straight plain adjustable bearing at the grinding wheel end. Adjustments for this bearing can be readily made through a hole in the top of the wheel slide provided for that purpose. This is the only adjustment required as the rear end of the spindle is mounted on ball bearings. A large sight feed oiler for the front bearing insures an ample supply of oil at all times.

The main drive bracket receives the power from the main line by tight and loose pulleys and transmits it directly by belt to the main speed box, wheel spindle, and pump. The guard for the tight and loose pulleys is adjustable, so that the openings can be lined up for the belt. The shifter lever is arranged with a spring plunger which locks it in place in the off or on position.

The main speed box, which is situated on the rear of the machine, furnishes power to the wheel slide by a three-step cone and three speeds to the chuck through a bank of gears. The speeds of wheel slide and chuck are independent of each other, allowing for a large latitude in regards speeds and feeds. The speeds to the chuck are controlled by a pull rod on the front of the machine.



GENERAL VIEW OF THE MACHINE.

All control levers and adjustments are within easy reach of the operator

The chuck spindle is driven by spiral gears, one of which is mounted directly on the spindle. This spindle is mounted in a sleeve, which has vertical adjustments. The upper portion of the spindle rests in a taper bearing, while the lower end is equipped with ball bearing. With this design adjustment is never necessary, as the wear is automatically taken up. The chuck bracket is adjustable to allow for grinding of concave and convex surfaces to angles up to 10 degrees.

The feed to chuck is made by a hand wheel and vertical screw through a nut on the spindle sleeve. The machines are also equipped with automatic vertical adjustment to the chuck, which will feed from .0005 to .003 at each end of the wheel traverse.

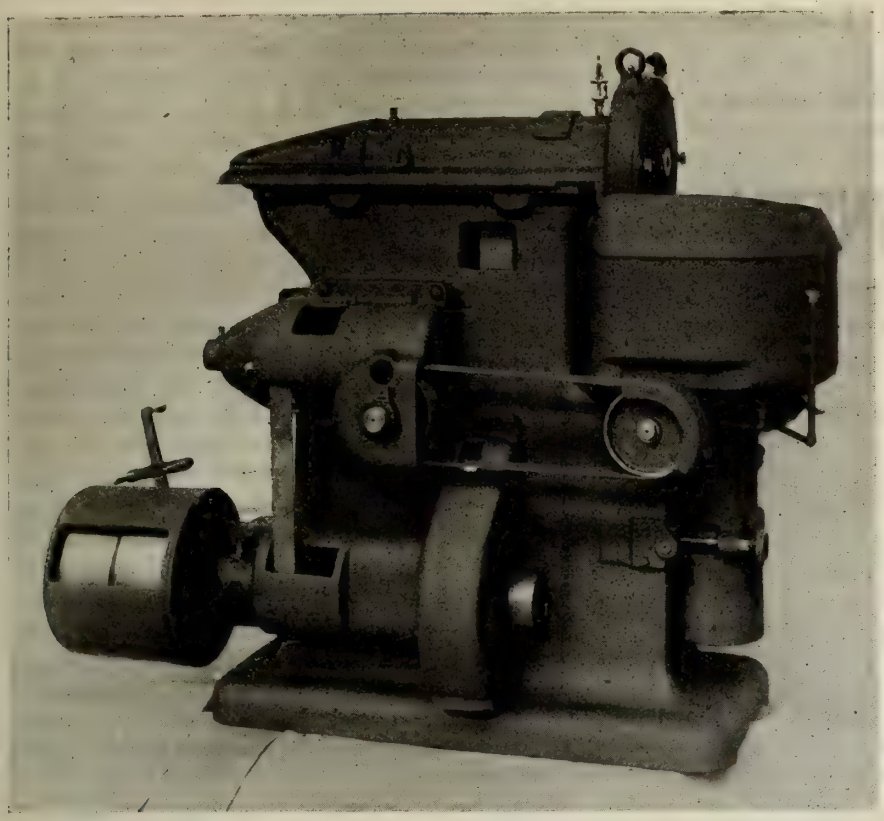
Water. The water equipment, including pump, tank, waterguard and connections, is regularly furnished with every machine. The tank is of unusual capacity, giving a most liberal volume of water, while a swivel joint in the distributing nozzle enables the operator to direct the flow at any desired point.

A Heald magnetic chuck, style 8 in. for No. 20, and style 12 in. for No. 22, are regular equipment. Three-jaw chucks or face plates with special fixtures may be substituted if desired or the work requires.

Motor driven machines can be furnished if necessary, the motor being placed where it is most convenient, on the floor, wall or ceiling, and belting directly to the main drive pulley. A few minor changes to the main speed bracket is all that is required when a machine is to be motor driven.

Specifications

12 inch.—



VIEW FROM OTHER SIDE OF MACHINE.

Diameter magnetic holding surface, standard chuck, 12 in. Face diameter, 13¾ in.

Size of grinding wheel, 12 in. diameter, 1¼ in. face, 5 in. hole.

Greatest distance, top of chuck to centre of wheel, 10 in.

Greatest distance between face of 12 in. diameter wheel and top of magnetic chuck, 4 in.

Smallest diameter grinding wheel, which may be used, 7½ inches.

Vertical adjustment of chuck, 5 in.

Largest swing inside of water pan, 16 in.

Floor space required, belt drive 48 in. x 70 in.

8 inch.—

Diameter magnetic holding surface, standard chuck, 8 in. Face diameter, 9¼ in

Size of grinding wheel, 10 in. diameter, 1 in. face, 3½ in. hole.

Greatest distance, top of chuck to centre of wheel, 8½ in.

Greatest distance between face of 10 in. diameter wheel and top of magnetic chuck, 3½ in.

Smallest diameter grinding wheel which may be used, 6½ in.

Vertical adjustment of chuck, 5 in.

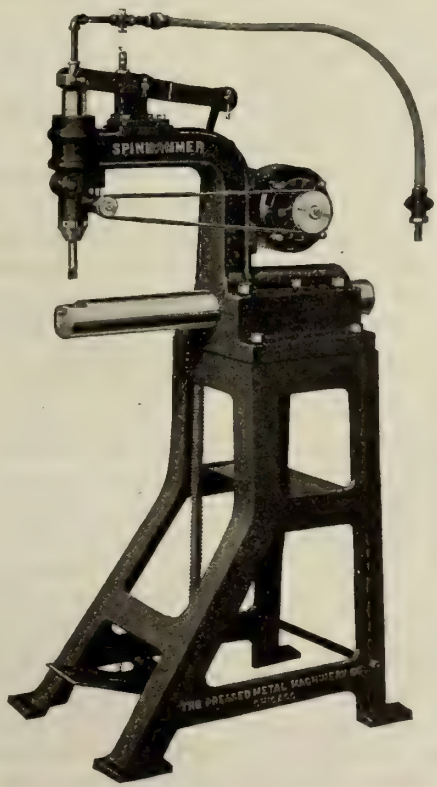
Largest swing inside of water pan, 13 in.

Floor space required, belt drive, 48 in. x 60 in.

SPINHAMMER FOR RIVETING

The accompanying illustration shows an improved type of riveting hammer developed by the Pressed Metal Machinery Co., 15 South Clinton Street, Chicago. This machine backs up the action of a regular rotary rivet upsetting machine, with the quick yet positive and powerful blows of an air hammer, which is built into the machine.

The rivet is set by the air hammer—not by the operator; the operator simply feeds rivets and work to the machine and upon his depressing the treadle, controlling the air valve, the hammer is thrown into action.



GENERAL VIEW OF HAMMER.

The rivet set or point is positively rotated by a self-contained ⅛ h.p. motor, transmitting its power through a rawhide belt and worm gearing. The chuck for the rivet set is integral with the worm itself.

The hammer head always stops at the top of its stroke or travel, thereby facilitating the insertion and removal of the work without any interference. The stroke of the hammer is adjustable from 2½ in. down to ½ in. to suit varying lengths of rivets or depths of work. This adjustment can be instantly made by merely turning up or down the thumb nut in the top of the operating valve.

The speed of the machine can be varied by increasing or decreasing the air pressure—the higher the pressure, the faster the speed, and the more quickly can rivets be set.

All parts are made to operate under and withstand a line pressure of from 60 to 200 lbs. per square inch.

Unlike the clanging noise of the ordinary air hammer, this machine merely issues a low humming sound and that only when actually upsetting work.

Interchangeable riveting and spoke-heading fixtures can be used, the frame being arranged and the machine is equally well adaptable for one as for the other type of fixture.

The spinhammer operates equally as efficiently on one style of head as another, the speed with which the work can be set depending entirely upon the shape of the head and the amount of metal making up the rivet head.

RAISING SUNKEN VESSELS

For attaching wire hawsers to the hulls of sunken vessels where a diver cannot pass them under a new method called the limpet system is described. The limpet is a soft iron body, carrying a number of drill taps driven by small motors, the current being supplied from the salvage vessel. The limpet is lowered until it comes in contact with the hull of the vessel when it is magnetized, causing it to cling to the plates. The drills are then started, and after running a predetermined length of time the current is switched off, the limpet is hauled to the surface and the drills are left tightly fastened in the ship's hull. The ends of these drills are formed into eyes, to which the hawsers can be attached.

The method employed by the R34 to determine her position is one that discounts atmospheric conditions, and does away with the need of a horizon, artificial or otherwise. A moving pointer attached to the wireless instrument points to the direction that the signals are coming from. If the signals are being received from three stations set at wide angles on the earth's surface, the navigator has only to perform a simple triangulation to determine his exact position.

Concerning Insurance

HAVE you enough insurance on your plant? Now this paper is not selling insurance, but the question is one that is prompted by knowledge of certain cases where losses have been incurred recently by the small amount of protection carried.

You have a good plant, worth hundreds and thousands. You probably reckoned the replacement cost when you put on the insurance and acted accordingly. Have you ever stopped to think what your replacement costs would be now? The buying price of machinery has doubled. Has your insurance kept pace? You say you are willing to take a chance and be covered on your initial investment. Well, that is your own affair, but there is a real situation here that cannot be overlooked.

A plant that has been in five or six years, bought at the prices that prevailed at that time, could not be replaced now for less than very close to one hundred per cent. increase. Just figure out everything, including transportation and labor costs, and see how far this statement is out.

If a fire should wipe your plant out to-night would your insurance policies, if they were all cashed, look nearly as large as when you took them out? The increase in costs has in reality amounted to a very serious shrinkage in the aggregate for protection. It is a point that should not be overlooked.

Using Power of the Tides

THE feasibility of securing a supply of electrical energy from the tidal waters in the coastal rivers of Britain is again being made the subject of close study. For some time this question has been approached more as an academic perennial than as a practical accomplishment.

Judging from figures that are now out there has been a real move made. J. Smith & Co., engineers of Glasgow, have worked on the idea for years, and are well posted on all needful data. The river Severn at Pitshead, for instance, supplies (on paper as yet) 4,773,730 H.P. The Dee, in North Wales, at Point of Air, Manai Straits, and the river Mersey above Liverpool Docks—show a total of 5,651,984 H.P. It is claimed that by this scheme power could be generated and sold at a fraction of the present prices.

An explanatory guide to the tidal waters power scheme has been prepared by Mr. Smith, who points out that on all rising tides the head water runs through turbines into inside of weir; on all ebbing tides the water runs through turbines to outside of weir. All doors are closed at low water, keeping out the rising tide; also at high water, keeping in full tidal water. All rivers start turbines working at half tide rising or falling. This gives the half tide head for the working of the later half. There being about three hours between the time of high water at the weiring point in the Severn and the other rivers, this gives three hours' run for the Severn, starting at half rising tide—say, 17 ft. head—inside water being at low water and finishing at high water, 34 ft. minimum tide. The other rivers being now at half rising tide, they take over the working from the Severn until high water on their rivers.

The scheme has in view the furnishing not only of power, but of light to all the homes in Britain.

Perpetual Motion

EVERY so often someone who ought to know better, someone with engineering experience and training, brings forth some perpetual motion scheme, usually in its conception as old as the hills. Sometimes it is an electrically-heated boiler, steam engine and generator and sometimes a generator and motor, variations being rung in by juggling the speeds of the machines or having them different. Most of these false conceptions as to the availability of energy arise through its confusion with work.

Perpetual motion, as envisioned by its devotees, is distinct from the engineering principles often forming the basis of somewhat chimerical schemes for the utilization of the power inherent in wave motion or, as suggested by a correspondent writing to an American scientific paper, the utilization of the residual energy of tap water before it enters the sewer. Such things have as their basis some germ of engineering fact but fail through their application to things of little account.

Such is not the case with perpetual motion and anyone who has an idea, in its essence more foolish than the search for the philosopher's stone, transmitting base metals into gold, would be well advised to hie himself to a secluded corner and apply the principle of the conservation of energy to his own thoughts and to their misguided conceptions.

The nearest approach to a source of inexhaustible energy obtained without effort is found in the action of the radio-active elements, and in this case, enormous as is the store of in intra-atomic energy and lengthy as is its life, it is not everlasting but slowly diminishes and is created at the expense of the radio-active element itself, the final product being lead of a slightly varying atomic weight.

Disappearance of the Old-Time Shop Joker

By J. H. MOORE, Associate Editor Canadian Machinery

WHILE much has been said and written about humor in the shop, it seems as if all the articles stop there and do not touch on the actual danger of such humor.

Recently the writer read an article in a machine journal which took rather a rise out of up-to-date toolmakers in general. It was stated that the toolmakers of to-day were far below the standard of 10 or 15 years ago. The author of this article even went so far as to state that old timers take a kindly interest when they see the newcomer trying to adjust his lathe to turn a taper, by prying over the rear end with a crowbar. How often does such an occasion arise?

He goes on to state that the old-timers, notwithstanding their propensity for practical joking, were a kindly, good-natured bunch, ready and willing to impart information, or render assistance where it was honestly and properly desired.

There is no denying the fact that the aforementioned old-timers were a kindly inclined bunch, and willing to aid the apprentice—but regarding the practical joking—did they step over the boundary line, and often cease to be funny—and just plumb foolish?

For example, it is hardly a year ago since some old-timers put it into some boys' heads that compressed air was a dandy thing to play pranks with. To make a long story short, they placed the hose in one boy, turned on the pressure, and soon there was one boy less in the world. Readers might well say, the fools ought to have known better, but the fact remains that they didn't. This is one example of misplaced humor.

The writer personally played a rather good (?) prank, one first of April some years ago.

It was his habit to eat chocolates practically every day, which made it easier for him to carry out his intention. This morning in question, he was chewing candy as usual, and passed round the bag as per the regular custom. Each member of the staff thanked the writer and indulged. Some, on biting into their chocolate, received a surprise in the shape of a piece of Surprise soap, others got red pepper centres. The master mechanic received a candy with a marble centre, and almost choked himself. The writer came very close to getting fired, which would have served him right, for it was another case of misplaced humor. Work for that morning was, to say the least, disorganized in this particular department.

Then there is the boy who will persist in placing a pin or thumbtack on your chair in the drawing office. Usually you merely jump and roundly curse the lad, but one case which came to the writer's attention resulted in a rather serious illness later on, through this simple prank.

There is another form of humor, much to be regretted, namely, monkeying with electricity. Monkeying is the correct term, for monkeys, as a rule, are always up to some prank or other.

Here are two examples. "Go on down and get me a pint of amps," were the instructions issued by a workman to a new apprentice not so long ago. Off went the green hand complacently, and luckily went to the chief with his request. This chief had risen to position of chief through his ability to stick to business in business hours, so without delay he made all concerned understand that humor such as this was strictly prohibited.

Suppose some other irresponsible workman had received this apprentice's request, there is no telling what the result might have been.

The second illustration started so simply and ended with a totally unlooked-for finish.

Did you ever take a lamp and socket, and, holding the globe carefully, place the brass socket near to a wide, fast-running belt? The result, of course, is that you store in the socket an enormous amount of static electricity. You then hand the socket to some unsuspecting individual, with the result that he emits a shriek, and drops the socket as he would a red-hot coal. Sometimes the kick in the socket is something fierce.

In this case in point the chap who was handed the socket received such a shock that he fainted, fell up against a moving piece of machinery and was rather badly smashed. It was some six weeks before he was able for his work. Of course this incident sobered up all concerned, but still it was another example of misplaced humor.

It often happens that accidentally a good joke occurs. This is, in the writer's opinion, true humor and worthy of a laugh—that is after it is all over.

The incident in mind is one which occurred years ago when the writer was serving his time at the machinist trade. There was a rather quiet chap working alongside the writer on a lathe of similar make to his own. Suddenly one day when this fellow was leaning over his work he let out a yell, a horrible yell, in fact. It looked to the writer as if this chap was caught by the overalls, so he rushed and shut off the motor, but still the yells kept on. Suddenly like a flash the solution came to all the fellows now gathered around. One of them went and shut off the light switch which made everything O.K. once more, for this was the whole trouble. This chap's shoes were wet and he was standing on a steel plate, had his one hand on the lathe bed, the other on the wire lamp shield, which was not properly insulated. Of course the result was a severe shock. We all had a good laugh—but not until it was all over.

And now, as they say in the movies—comes the close-up. This same chap was working industriously away one day, when someone, trying to be funny, hit him behind the joints of the knee with a board. Of course he jumped, but in jumping got caught in the job which was being turned. It was his arm that caught, with the result that it was broken.

Which of the two cases is true humor?

Last but not least, another little tale which looked harmless, and was harmless in the shop, but very much otherwise outside the plant.

This fellow had just come over, as they say, about the newly-arrived from the Old Country. He dropped in this morning, asked for a job, admitted he was not a machinist, but knew what a drill press looked like. The foreman took him on as he needed a drill hand immediately.

The new hand started work, but his drill was none too good, and off he went to sharpen it. Here was our opportunity, so we crossed his belt on him before he returned.

In went the newly-sharpened drill, down went the hand feed lever, but horrible to state, the drill refused to drill. There was a sort of worried expression on the new hand's face, but he decided he could not have sharpened the drill correctly, so back he went. He returned but with the same result. To make a long story short, he did this about 4 times, without discovering the trouble. In the midst of his earnest search after the difficulty, the foreman dropped around to see how he was getting along. It didn't take very long for the foreman to size up the situation, with the result that the man put on his coat and hat.

Worth-While Information From Many Points

If equal parts of copper and antimony are melted together it forms an alloy of a beautiful violet color, which takes a nice polish, but, being too hard for many purposes, a substitute can be produced by taking an iron casting and copper plating it, after which immerse it for a moment in a solution containing antimony.

August 25th of this year is the centenary of the close of James Watt's life. At a meeting of the engineers of Birmingham (the city of his adoption) it has been decided to erect a James Watt Memorial Building to serve as a museum, and also to endow a professorship of engineering, to be known as the James Watt chair, at the University of Birmingham, for the promotion of research in the fundamental principles underlying the production of power and the study of the conservation of the natural sources of energy.

Where great power is applied slowly, particularly when space is at a premium, the worm-and-wheel drive is seen at its best. Another advantage of this type of drive is the ease with which it can be kept oiled. Perhaps greased would be a better term because the worm frequently works in grease. The whole drive is usually enclosed in a grease-tight box, though which passes the driving shaft.

Belts form a very important part of the equipment of factories—a part of equipment that is habitually used, however, in most inefficient and wasteful manner. There are exceptions, notably in connection with the more modern machinery. But many belts are running at an average speed of nearer 1,000 than 4,000 or 4,500 feet a minute. As a result six-inch belts are used where one-and-a-half or two-inch belts would be not only much cheaper in first cost but also much better. Bearing pressures are materially lessened, while friction and the accompanying wear and power consumption are reduced. This tends to conserve leather, fuel and oil, and lower repair expense.

In a certain plant the technical magazines which are received are first read by the engineers in the office. They are then placed in a box made especially for this purpose, at the employees' entrance. Any worker may take one at a time home, and after reading it, return it to the box so that other employees may read it. This scheme is worthy of more general application.

It is not generally known that sea lions played a most important part in sea warfare. The British Admiralty used these animals to hunt U boats. First the animal is trained to follow sounds from the water's depth. After graduation it is put overboard whenever U boats are believed to be in the vicinity of the ship. These animals proved a decided success and well worth the trouble spent in training.

Now comes the long-spouted oil can for lubricating revolving shafting, without going up to the danger zone. You merely stand on the floor, place this special oil can in position, press a button and out comes the oil. The inventor if this new can claims that dozens if not hundreds of lives will be saved with his device.

The annual output of thirteen billion gallons of petroleum in the United States consists of 1,800,000,000 gallons of kerosene and about twice as much gasoline, the remainder being gas oil, distillate and light and heavy residuals.

Salonika will become one of the most important ports of the near East if improvements started by the Greek Government are carried out. Expenditures of $100,000,000 are planned, and include a city water supply, drainage and sewer works, dock extensions, railway stations and underground railways, 100 miles of new streets with housing developments, theatres, etc.

It is anticipated that German railway systems will find great difficulty in rebuilding their lines to pre-war standards, and that cheaper construction will have to be used, both on account of scarcity of raw materials and also financial difficulties.

When a steel article with a metallic coating is scratched or abraded so that a small area of steel is exposed, the two metals will, in the presence of atmospheric moisture, form a galvanic couple or cells in which a current will be set up. The metal, which is electro-positive to the other, will be oxidized, while the electro-negative metal will remain uncorroded. When the coating is zinc, it is the zinc which will be oxidized. If, however, the coating be tin, which is electro-negative to iron, the steel will be attacked. Therefore tin as a protective coating is useful only so long as the coating remains everywhere continuous. Aluminum makes a good protective coating for steel. In the method called calorizing the metal object is placed in a mixture containing aluminum and heated up to 900 to 950 degs. C. By this means a coating of aluminum which penetrates into the iron is obtained.

In Canada the developed water power is estimated at 1,735,598 h.p., while the power available is placed at 18,803,000 h.p.

In the Great War some of the losses in killed were as follows: Russia, 1,700,000; France, 1,385,000; British Empire, 692,000; Germany, 1,611,104; Austro-Hungary, 800,000; Turkey, 300,000; Italy, 460,000; Serbia, 320,000; United States, 67,813.

The Dominion of Canada, since the beginning of the war, borrowed from the Canadian people no less than $1,436,000,000. This amounts to $192 per capita of population.

H. L. Van Keuren, chief of the gauge section, U.S. Bureau of Standards, says that any workman, with a glass true plane and light, can measure accurately to the millionth of an inch.

Figures have been given out showing the way in which costs of running the British railways have been mounting up. The present estimate of increased cost in working the railways during the financial year ending March 31, 1920, as compared with 1913, was from 104 to 109 millions, made up of war wages and other concessions, 57 millions; 8-hour day and new concessions recently gratified or still under discussion, 20 to 25 millions; and extra cost of materials and coal, 27 millions.

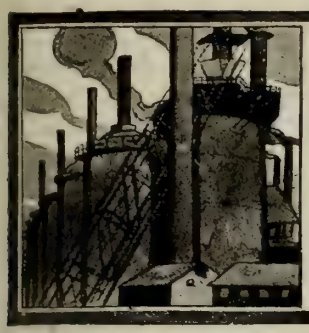
On one occasion last year the Westminster clock showed the wrong time to the extent of three seconds, but the error was less than a second on 151 days. The clock is checked but not corrected daily. The time ball at Devonport was correct to within a second throughout the year; that at Portsmouth was out of time to the extent of from one-half to one second on two occasions, and the Portland ball was incorrect to a similar extent on four occasions.

Corrugated iron huts, measuring 30 ft. by 15 ft., at £40 each, are one of the features in "Surplus," the second number of which has just been issued by the British War Office. The publication has been extended considerably, and many of the materials are now listed according to the county where they are situated. The Ministry announces that this paper, "Surplus," is issued to catalogue the left over and surplus war material.

The Nova Scotia Government is to create a hydro-electric commission similar to that in Ontario. Two bills, one to authorize the development of water power and the other to lay down regulations covering water and water courses, have been introduced in the Provincial Legislature.

The proposed extension of the water supplies to Moose Jaw, Sask., Con., will entail laying a pipe line about 70 miles long. The pipe will be of wood and 24 in. in diameter. The relative costs of wood, steel, and cast iron pipe for the work are in the proportion of 2.3, 5.7 and 10.5.

A. R. Roberts, formerly if Burns & Roberts, Ltd., Toronto, has discontinued his connection with the firm, and has opened an office at 201 Bank of Hamilton Building, Toronto. He will deal in new and used machinery, contractors railway and power plan equipment.



MARKET DEVELOPMENTS

Waiting for Period of Big Buying in Canada

Firms in This Country Still Buy Largely for Immediate Needs—Several Changes in Prices—Copper Stronger and Looks Like More Advance

THERE is a real and a noticeable improvement in the business going to the larger steel mills of U.S., and this is almost certain to be reflected at the Canadian mills and in business in general. The trade is discussing the new contract made between the Dominion Government and the Dominion Steel Corporation, and the opinion does not seem to be favored that steel at the price named, 3.65, can compete in this district. Taking Toronto as a given point, the Sydney plate would be 4.20 per pound, while Pittsburgh would lay it down here for 2.92½, plus exchange, leaving a margin too great to be discounted or ignored.

Speaking of plate, it is reported that a good tonnage was placed this week by the National Railways.

Buying is not improving as it had been hoped it would. Before the war there were plenty of concerns in Canada who made up an order covering many lines, such as plate, tubes, iron, bars, etc., that would be enough for an ordinary year's operations. Now most of these companies are buying for immediate wants only, and as a result business dribbles along and the mills do not get the much-wanted big tonnage orders.

Makers of some lines of machinery have served notices of advance. This is for material not much used in war work, and which has not risen far past pre-war prices. Against this, chain prices are eased off to the extent of $20 per ton. Chain did not come down immediately following the war, and the present reductions are practically delayed concessions.

The metal market is strong. Copper, it is anticipated, is in for a fairly well-continued session on high levels. Copper went very much to pieces directly after the war, but has been coming steadily back ever since. It is well above pre-war levels. Copper on the 31st of July, 1914, a day or so before the war, was quoted at 13, while the latest figure at New York names 23½c. The tendency is still up.

PITTSBURGH REPORTS THAT BUSINESS IS IMPROVING IN REAL EARNEST

Special to CANADIAN MACHINERY.

PITTSBURGH, Pa., July 17.—The report of steel ingot production in June makes an even more favorable showing than was expected. All observers recognize that there was much better mill operation in June than in May. With increasing operations during the month, even at the close of June few mills estimated their operations at over 70 per cent. of capacity, and as May had shown an average operation of 54 per cent., a fairer estimate for June appeared to be about 60 per cent. The official report since made, however, indicates an operation during June averaging 67 per cent. of capacity. The first four months of the year showed rates as follows: January, 87 per cent.; February, 85 per cent.; March, 77 per cent.; April, 65 per cent.

A little analysis of these figures will indicate how great an improvement there has been. It will be observed that the 54 per cent. average for May was far below the rates for April or June, and thus it is clear that at about the middle of May the rate must have been lower, probably not over 50 per cent. On the other hand, with production steadily increasing during June, and an average of 67 per cent. for the whole month, the rate at the close of the month must have been about 70 per cent. Accordingly there was a rate of about 50 per cent. at the middle of May and a rate of about 70 per cent. at the end of June, only a month and a half later, showing an increase in tonnage output of 40 per cent. in that short space of time.

The computation of percentages of operation are based on the monthly reports of the American Iron and Steel Institute, giving the output of 30 companies which in 1918 produced 84.03 per cent. of the total steel ingot output. The production of the 30 companies was 2,219,219 gross tons in June against 1,929,024 tons in May.

Production for the first six months of the year was at the average rate of 35,500,000 gross tons a year, for the whole industry, or at about 72.4 per cent. of capacity, which can be estimated at 49,000,000 tons a year.

Steel Corporation Business

The monthly report of unfilled obligations of the Steel Corporation shows that in June there was more contracting for forward deliveries of steel products than was reported at the time. It was well known that there was a continuous increase in the booking of actual shipping orders, comprising specifications against contracts together with new orders, specifications attached, but it was not supposed that there was much contracting for forward deliveries. For months there had been practically none at all, and some sales agents were remarking that they had forgotten how to fill out contracts, as the business received was all in the form of shipping orders.

The Steel Corporation report, however, showed 4,892,855 tons of unfilled obligations at the close of business, June 30, this including contract obligations as well as shipping orders. The increase during June was no less than 610,545 tons, whereas each of the preceding six months, beginning with December, had shown a large decrease, these decreases averaging 640,000 tons a month. These monthly reports are not a reflection of the rate of booking orders on which the mills actually operate. A month may begin with a certain volume of unfilled obligations and the mill may ship heavily, merely upon specifications against the contracts, whereby at the end of the month the unfilled obliga-

tions would be found to be decreased by the volume of the tonnage shipped. On the other hand a mill might book a large volume of contract business in a month but have very little tonnage of shipping orders on which to operate. Thus the main thing the Steel Corporation report shows is that contracting in steel products is now in vogue again.

Lake Ore Movement

Shipments of iron ore down the lakes in June amounted to 7,980,839 tons, against 9,921,860 tons in June a year ago. The season total to July 1 is 16,-008,419 tons against 18,949,730 tons for last year's season up to July 1. While there is a falling off of 2,940,000 tons the showing as to trade prospects is by no means unfavorable for the reason that there has been a large surplus of ore to liquidate. Last year's ore shipments were sufficient to carry the blast furnaces with full supplies up to about June 1 of this year, but as the war ended the production of pig iron declined very materially and not as much ore was used as had been provided. Indeed, the ore movement up to July 1 was almost wholly by the producer-consumer class, very little merchant ore being moved because the furnace interests that buy ore had not taken hold as to purchases for the season. Some had declared that they would not buy until about August 1, expecting the market to decline. Several weeks ago it became evident that ore prices would be held strictly and so there has been buying in a moderate way in the past two or three weeks, and the ore movement for the remainder of the season will probably show a picking up. The basis price for the season is $5.55, for Mesabi non-Bessemer ore at Lake Erie dock. An advance of 25c went into effect Oct. 21, 1918, under the auspices of the War Industries Board, making the price $5.75, but there is a 20c reduction for this year due to the lake carrying rate declining from $1 to 80 cents.

Railroad Buying

One of the chief things the steel industry now needs is a fair volume of railroad buying. Some departments of the finished steel trade that do not make materials used by the railroads are doing very well, while the branches that furnish railroad material are at the bottom of the list in point of activity. About three weeks ago it was reported in the inner circles that the Railroad Administration was about to place orders for 300,000 tons of rails, but nothing has come of this to date. It is surmised that possibly the Railroad Administration sees its way clear to returning almost complete control of the railroads to their owners at an earlier time than expected, though of course the earnings guarantee will run to the end of this year in any event. Thus it may be that the individual railroads will soon be in a position topla ce orders on their own initiative and responsibility. Another thing the steel industry needs is more construction work by way of large jobs, including bridges, large buildings, factories, etc. The erection of dwelling houses promises to be heavy the remainder of the year, judging by reports from various centres, and the fact that the nail departments of the wire mills are practically filled up for the next two or three months is concrete evidence of this activity, but that does not help the structural mills, which have a very light operation, in keeping with the rail and plate mills.

POINTS IN WEEK'S MARKETING NOTES

A Belgian concern has purchased practically all the machine tools that were left on the American market. The price was based on 1914 figures in many cases.

—

There has been a very decided improvement in the purchasing of steel, according to reports from Pittsburgh.

—

Prices on chain were marked down to-day 1c per pound or $20 per ton on electric and proof coil.

—

Some machine-tool makers are announcing increased prices on lines that were not much inflated during the war.

—

Dealers state that plate made at Sydney at 3.65 cannot compete in the country for business. In Toronto, for instance, the price would be 4.20 against 2.92½ for U. S. plate.

—

Very little improvement is to be noted in the amount of buying going on. It is still on a small basis, purchases being confined to needs.

Pig Iron Moving

The pig iron buying movement is not altogether over, as it was thought at the end of June it might be. While there has not been much activity in the past week or two there has been some, and with the furnaces now in operation well filled for the third quarter, some of them practically through the year, the market is quite steady. Predictions of price advances in the near future do not seem to be well timed, however, as when idle furnaces see improving business ahead they generally hasten to get into blast and they are not very particular as to the prices obtained by the "back log" business they generally take before they blow in. Rarely does a furnace blow in to make up stock.

Mr. Robert K. Newton, formerly assistant manager of sales at Brown's Copper and Brass Rolling Mills, New Toronto, Ont., was appointed to the position of general sales manager on July 1.

Canadian Plate Will Be Too High

That is Opinion of Some of the Dealers —Market Doing a Fair Summer Trade

Toronto.—There is not a very large amount of business going this week, although some of the firms that have been in the market for equipment are still taking on material.

Inquiries are numerous, in fact there is a lot of business to be converted into cash, and it will surely be coming into the market in the not distant future.

Notice of Increases

Reference has been made in these columns several times to indications of higher prices for machine tools. Just how this will affect the sales is somewhat of a guess, and there seems to be a sharp difference on the advisability of such a move at the moment. Machinery is still on a high level, and any additions that are made will cause the purchaser to look rather hard at used equipment that may be on the market. Cochrane-Bly are out now with an announcement of a 20 per cent. increase on universal shapers, cold sawing equipment, etc., the raise running from 7½ to 20 per cent. It should be added that these machines did not increase much in price during the war, and even yet are much nearer old prices than many other lines that went up much and came down little.

The automobile business is the best anchor at present when it comes to real business. There has been a lot of buying done by the automobile interests, and there is going to be a lot more done. The making of differentials, with a heat treating plant, has been closed for the Willys-Overland people.

Dealers are inclined to be a little disappointed at the amount of business they are securing from the railroads. The National Railways have been out on several occasions with large lists, but they have not resulted in the placing of a very large amount of new business. For instance a Bullard boring mill is called for now, and the price will be around $8,500. Not so very long ago the purchase of one of these machines was urged at $6,500, it being in first-class shape, only running in a war shop for two months. The matter was delayed too long at the time, and the new machine will have to be bought now. Of course the machine tool salesman should not be particularly worried over the prospect of selling a brand new boring mill.

The railways are asking for bids on other lists just now too.

The Steel Trade

There are little pockets in the market that bring forth queer happenings. For instance a few days ago one dealer brought out a car lot of black sheets and offered them to warehouse interests for less than the Pittsburgh price to-day. He was rather out of that line now and anxious to unload. The same things hap-

pen at the mills now and then. Some interest comes to the top and takes a flyer into the market with the idea of hunting up a little added tonnage for immediate working. However, these things have always been in the market, and always will be, and they in no way touch the stable tone of the transactions.

The fact is, and it does not take much looking to discern it, that the market is even stronger than the prices indicate. Buying is not improving as it had been hoped for. There is still the policy of dribbling. Some years ago a firm would make up a list covering its requirements in plate, tubes, iron, bars, etc. The sales agent would have a trip and a good busy session. He would either get the year's business in a lump or he would lose it. Now these same places are nearly all buying in small lots.

There is a new price out on proof coil and electric weld chains which shows a reduction all round of one cent per lb. The reason is that chain did not come down along with other lines after the war. In fact it stood pat during the several reductions that were announced in steel.

The New Plate Mill

"Will there be any chance of the plate that is rolled at Sydney, under the new contract, coming into the market here as a competitor at a price?" asked MACHINERY of one of the big selling organizations this morning.

"Absolutely no," was the very emphatic reply. "The price is still away high. If they are going to pay 3.65 per pound for plate, they cannot compete for the business that is passing here. Plate from U. S. mills can be laid down in Toronto at 2.92½, while plate from Sydney at 3.65 would cost a good 4.20 when landed here. Of course Montreal would get a closer rate, but even that would not help matters."

The Scrap Market

A good amount of business is going through the scrap yards at present, and buying is fairly liberal, but prices are staying about where they have been for some weeks. There is more material coming on the market now than for some time past, and shipments out are correspondingly larger. Some misunderstanding is noticed in Montreal and Toronto quotations, owing to the higher figure for Montreal. Montreal is not only a consuming point, but its quotations are based on gross tons, against the net tons meant in the Toronto quotations.

Copper Market Strong

New strength is evident in the copper market, and prices are coming along showing decided evidence of increased strength. The copper prices have mounted well above pre-war figures. Electrolytic is quoted now at 23½, against 13 cents on July 31, 1914, a few days before the start of the war. Production costs are higher, of course, and there is going to be a tremendous demand for copper in many sections of the world.

MUCH BETTER FEELING NOTICED IN THE MONTREAL TRADE OF LATE

Special to CANADIAN MACHINERY.

MONTREAL, Que., July 17.—There is an undoubted improvement in the tone of the general situation, and while actual business has shown no marked increase, there is nevertheless a better feeling prevailing in trade circles. The announcement that the Government has renewed the contract with the Dominion Steel Corporation, at an adjusted figure, has had the effect of reassuring the steel interests of the continuance of shipbuilding and other activities for an extended period. The large plate mill at Sydney, the construction of which was suspended several months ago, will now be rushed to completion, and actual production of plates will be possible early next year. The strike situation is less pronounced and many settlements have been made or are pending. Shipworkers at Canadian Vickers will, probably, be all back to work this week. Business in and about the harbor is very active and every vessel leaving port goes out with a full cargo, the greater portion of which is food supplies and lumber. Steel merchants in this district report little change as a result of the signing of peace, but are hopeful of better business developing before the summer closes. The metal market is firm and the demand is slowly but steadily increasing. Business in machine tools is largely on used equipment. Old materials have been fairly active and firmness is maintained.

Metal Improvement Holds

The improvement that has been noted in the metal market during the past few weeks appears to be holding its own, and while the volume of sales may not denote a buying movement, there seems to be a more confident feeling expressed on the part of the consumer and sales are more regular. Small quantities are still the feature and trading does not show any great tendency on the part of the purchaser to carry supplies other than those required for immediate or early operations. It is believed that Germany will soon place large copper orders with the States, and this will be an influential factor in maintaining a strong market. It is reported that American supplies on hand are steadily decreasing, and as mining and refining are somewhat disorganized, as a result of shutdowns, some little difficulty may be experienced in securing labor for this industry. The movement here is not heavy, but it is of a steady character, and dealers are quite satisfied with the current volume of business. Coppers are again marked up one cent per lb., the quotations being 24 cents for lake and 23 cents per lb. for electro and castings. Spelter is in beter demand and prices have advanced to 9½ cents per lb., this quotation being one cent higher than last week. Other metals are nominally firm on light, but steady demand.

Machine Tools Still Quiet

One is at a loss these days to state, definitely, the actual condition in the machine tool industry. Some dealers report a fair volume of business, while others state that nothing is coming in. On the whole, it would appear that, apart from the sales on used equipment, the activity in machinery is confined to the requirements of a few new developments and for railroad purposes. The general demand is undoubtedly quiet. Inquiry is still of a character that might imply early buying, but apparently few of such inquiries have ripened to the point of purchase.

Scrap Remains Unchanged

While there appears to be a little hesitation about holding prices at their present level, the dealers here are reluctant at making reductions this week. Business has been fair during the past few days, and while some appear to incline to lower quotations, no definite action is yet noted. However, it would not be unexpected to see some changes next week. Coppers are quite firm, but other metals and steel scraps are developing an easier tendency.

Machinery Exhibition.—The Right Honorable Lord Weir of Eastwood, has promised to open the Shipping, Engineering and Machinery Exhibition at Olympia, England, on September 25th next. This exhibition, of which Sir Owen Phillips, G.C.M.G., M.P., is hon. president, Sir Archibald Denny, bart., chairman of the Committee of Experts, and Mr. F. W. Bridges, secretary and organizing manager, and which was to have been held in the autumn of 1914, but in common with other important events, had to be postponed on account of the war, will afford the general public an opportunity of becoming acquainted with the luxury, comfort and ease of present-day sea travel. The interval which has since elapsed has, moreover, afforded British engineers an opportunity of introducing vast improvements in connection with marine and general engineering, with the result that Olympia will be full to overflowing with machinery and appilances of intense interest to all concerned with the shipping, shipbuilding and engineering industry, and the exclusion of everything of enemy origin will enable the British public to see how absolutely independent we can be of anything produced in enemy countries, at any rate, as regards this particular industry. The exhibition is to remain open for three weeks.

BELGIAN CONCERN IS REPORTED TO HAVE BOUGHT UP U.S. WAR MACHINES

Special to CANADIAN MACHINERY.

New York, July 17.—Recent newspaper reports from Europe that the United States Army has sold all of its used machine tools abroad to La Construction de Metallique de Belgique, a Belgian manufacturing concern, is confirmed by Secretary of War Newton D. Baker. Machine tool builders who had been opposing the sale of Government tools abroad, maintaining that it was ruining the business of American builders, have withdrawn their objections. Secretary Baker says that the sale abroad was on the basis of August 1, 1914, prices, plus 55 per cent. c.i.f. Antwerp. He adds that the average price advance reported by 133 manufacturers in this line from 1914 to 1918 was approximately 93 per cent., and the average drop on new machinery since the signing of the armistice has been about 20 per cent.

Sales of used machinery by the War Department to date have totalled $3,200,411.10. This equipment cost the Government $3,898,833.85; therefore the Government has realized about 82 per cent. of the cost prices.

The first important inquiry from Europe for machine tools since the signing of the treaty of peace, has been issued by the Framerican Industrial Development Co., New York, representative here for the Creusot Works, France. About 30 large tools are required for a steam turbine plant, and immediate delivery is asked.

The Niles, Bement, Pond Co., New York, has received an order from the Navy Department for 42 large lathes for the naval ordnance plant at Washington, D.C., the cost being about $750,000.

Four ship repair plants are soon to be built on the Atlantic coast, under arrangement with the Emergency Fleet Corporation. The latter organization will build two 10,000 floating dry docks for each plant, and adequate shops for the repair of ships will be built and equipped. Contracts for this work are about to be signed. The four plants will be operated by the Norfolk and Hampton Roads Ship Repair and Dry Dock Corporation, Norfolk, Va.; the Perth Amboy Dock Co., Perth Amboy, N.J.; the Ramberg Iron Works, Brooklyn, N.Y., and Fraser, Brace & Co., New York City.

Machine tool business in the East continues in moderate volume. The Spicer Mfg. Corporation, Plainfield, N. J., bought about 15 or 20 tools last week, this being the most important buying by any manufacturer in the East in several weeks. Companies making candy machinery are very busy, and several of them are buying new equipment.

Prices are quite firm, and some advances have been made. The tendency toward making concessions is lessening. Machine tool builders are looking for a much better business during the latter half of the year. Many projects are pending which will doubtless come to fruition as soon as the business situation shows a further improvement.

PROVISION IS ALREADY BEING MADE FOR BUSINESS DURING NEXT YEAR

BUYING for next year's requirements of pig iron has started. Transactions of over 20,000 tons have been booked. Following are reports from United States centres:

PITTSBURGH.—The feature of the market has been the buying of large quantities of malleable for the end of this year and part of next. The feeling of consumers is evidently that prices are as likely to go up as down, and this is borne out by the fact that furnaces are not keen on booking business for 1920. There have been fair sales of foundry and bessemer.

BOSTON.—Business during the week preceding the holiday was confined to small lots, mostly of carload proportions. Some sales of 200 to 500 tons were made. Prices have remained firm, and furnaces are not keen on quoting for future business.

BUFFALO.—While the big rush is over a number of enquiries are coming in, and a fair amount of sales are being made. Furnaces are pretty well booked up and not much tonnage is available from stock. More stacks will be put in operation shortly.

NEW YORK.—Demand for pig iron has been very weak, both for domestic use and export. It is understood that the 20,000 tons enquired for from England has gone to a Luxembourg furnace, at $38.40 c.i.f. an English port, which is away below any American offer.

CLEVELAND.—Sales amounting to about 50,000 tons, mostly for outside points, have been closed during the week. Buying is quieter, as most of the furnaces are booked up for the rest of the year. Steel making grades are still inactive.

CINCINNATI. — Southern furnaces are fairly well stocked up with orders, and prices firmer in consequence. Furnaces are quoting the full schedule price of $28 for 2.25 to 2.75 silicon iron. No quotations are being made for 1920 iron.

ST. LOUIS.—While quietness is the leading note in the market this week, prospects are good for future good business. Automobile and truckmakers are working to capacity, and stove makers look forward to heavier business than at any time since before the war.

BIRMINGHAM.—Good enquiry for fourth quarter is forthcoming, and if the demand keeps up it is likely that more stacks will be blown in. Not much iron has been sold for last quarter delivery. Production for July is likely to be much higher than June.

PHILADELPHIA.—The market here is keeping fairly brisk, domestic foundry sales amounting to 20,000 tons being made. Some sales have been made to England at $39.60 c.i.f. Bristol Channel. There is business enough in sight for two or three months' activity of furnaces now working.

CHICAGO.—Buying of foundry and malleable is progressing normally, but there is no demand for steel making grades as yet. One Chicago interest sold 125,000 tons of pig iron last month, and now reports business picking up again.

STEEL MAKERS ARE IN THE MARKET NOW

Scrap is Being More Eagerly Sought; Some Districts, Though, Remain Dull

The scrap market, although showing dullness in some districts, is, on the whole, firm and on the upward grade. Following are the reports from various centres:

CHICAGO.—With the exception of rolling mill grades, all scrap is active and prices rising. $25 is predicted for heavy melting steel in the near future.

BOSTON.—There is considerable activity locally, with some price advances. Machine shop turnings are quoted from $8 to $8.50, while blast furnace turnings are from $7.50 to $8. Rerolling rails have been quoted up to $16.

NEW YORK.—Dullness due to the holidays in part, has resulted in prices remaining stationary, and, in some cases, dropping slightly. Heavy melting steel is a case in point, this grade dropping about 25c per ton.

PHILADELPHIA.—There is a good demand for all grades, and prices continue to advance. Heavy melting and No. 1 railroad wrought have sold up to $19 and $25 respectively. Heavy axle and forge turnings have been sold as high as $15.

PITTSBURGH. — The steel makers are coming into the market, and dealers are, in some cases, marking up their prices. $19 delivered for heavy melting steel has been paid, and the quotations are now up to $20. There is a good demand for rails.

BUFFALO.—There is a brisk market for all grades of scrap, and dealers' stocks are comparatively low. Dealers are predicting a shortage in the near future, especially as no country scrap is offering.

CLEVELAND.—Dealers are offering more for steel than consumers and yard interests are expecting much higher prices for the steel they have in stock. They say they would not consider $21 for it.

CINCINNATI. — Although little business was done, prices are nominally higher. Demand is better for No. 1 railroad wrought, cast scrap and rerolling rails. Steel turnings show weakening.

DISAPPEARANCE OF THE OLD TIME SHOP JOKER

(Continued from page 57.)

And now comes the sequel. This chap had a wife and four children on the way over, and had tried very hard to secure some employment previous to coming to our firm, but without success.

He had landed this job at our plant, and if left alone, might have, in fact, no doubt, would have filled the bill, for the class of work he would have been given would have been fairly simple. However, our humor (?) changed all this, with the result that when his wife arrived they had some plugging before they could make ends meet. He could not secure a position and she was forced to work until later, when, on hearing the circumstances, we went to the foreman and requested he look over the matter and bring him back. The foreman was a good sort, saw our point of view and brought the fellow back. We had learned our lesson in the meantime with the result that later this chap spoken of developed into a first-class drill hand.

Of course we all remember the old trick of smearing the bottom of the file handle with red lead, of sending the greenhorn for the rubber wrench with glass jaws for polished work, and last but not least, the old, time-worn, hairy, and gory quest after the left-handed monkey wrench.

These are harmless, foolish jokes, but nevertheless interfere with efficiency in the shop. Compare the shop of 10 years ago with the plant of to-day and note the decided improvement over former conditions.

Operations, etc., are now systematized to such an extent that there is no time for such humor, for which we offer due thanks. Practical joking may be all right in its place, but its place is not in the shop, or office, especially in business hours.

THE PERFORMANCE OF THE MOTORS THAT CROSSED THE ATLANTIC FIRST

The crowning triumph for the Rolls-Royce aero engine is the first direct Atlantic flight, accomplished in 15 hours, 57 minutes, on a Vickers "Vimy" plane. Not the least remarkable part of the feat is the high average speed maintained, viz., 117½ miles an hour. Evidently the two Rolls-Royce engines fitted to the Vickers Vimy plane must have worked perfectly throughout the 1,880 miles flight.

It has been calculated that if the Atlantic crossing were completed in 20 hours by one Rolls-Royce engine running at an average of 1,800 revolutions per minute, its performance would be as follows (in a two-engined plane such as the Vickers Vimy the operations would naturally be doubled): Each engine will make 2,160,000 revolutions, and each piston will travel up and down the interior of its cylinder a total distance of 440 miles. As the Rolls-Royce engine has 12 pistons they will in all travel 5,280 miles. The valves will be operated some 25,-920,000 times in each engine, the magnetos and sparking plugs having to deliver the same number of sparks for the ignition of each engine.

The recent history of the Rolls-Royce aero engines discloses one or two very interesting facts.

On Nov. 11, 1918, when the armistice was declared, there were in possession of the R.A.F., Rolls-Royce aero engines of a total horse power of over 1,000,000, which far exceeded that of any other make of aero engine in use. Previous to armistice day, Nov. 11, 1918, there had been constructed 122 Handley-Page bombers of which no less than 113 were fitted with Rolls-Royce engines. Prior to the same date, 1,524 complete Bristol Fighters had been delivered, of which number 1,364 were also equipped with Rolls-Royce engines. Rolls-Royce engines were used exclusively in the planes of the London-Paris Government courier service for the conveyance of the ministers, officials and despatches to and from the Peace Conference, the speed record between London and Paris, viz., 75 minutes, standing to the credit of the Rolls-Royce aero engine. The only two aeroplanes which have flown from England to India were both fitted with Rolls-Royce engines.

MONTREAL NEWS

L. A. Desy, consulting engineer of Montreal, will shortly complete the construction of a large power plow, capable of plowing a strip of land 40 feet in width; the plow is of unique design and will be ready for a practical demonstration in the course of a few weeks.

Canadian Vickers employees return to work this week after a strike of six weeks' duration. Negotiations have been carried on constantly and no disturbances marked the progress of the strike.

In order to take care of the increased railway requirements on the harbor front, the Montreal Harbor Commissioners may take over the south side of Common and Commissioners streets—which is their property—and lay down railway tracks. In view of this the Harbor Commissioners have requested the city to transfer the tram tracks to the south side of the street.

Residents in the vicinity of the Montreal abattoirs are, at last, assured that their nasal organs will be relieved of the offensive odors arising from the production of animal food. Plans now in progress will, it is claimed, guarantee smell-proof rendering plants.

Roy M. Wolvin, vice-president and managing director of the Halifax Shipyards, has been elected a director of the Dominion Steel Corporation. Mr. Wolvin's knowledge of the transportation of ore and coal will prove of inestimable value to the steel corporation.

That inter-Empire trade opportunities await Canadian manufacturers is shown in the visit of G. E. Whitehouse, of London and Edinburgh, who is here on the invitation of the Canadian Government, to ascertain the commercial possibilities of this country. "You can produce more manufactured articles than you can consume, because your population is small," said Mr. Whitehouse, "and you may just as well sell those things to us and keep the business in the family, for the more business there is between two people the better they will understand one another. What I want to find out is the names of the firms who are actually ready and willing to ship their products to England."

The possibilities of export business is exemplified in the loading this week of twenty Canadian built locomotives, on the Elder Dempster freighter Kwarra, for the South African Government Railways. The same boat will carry a large number of Canadian-made automobiles.

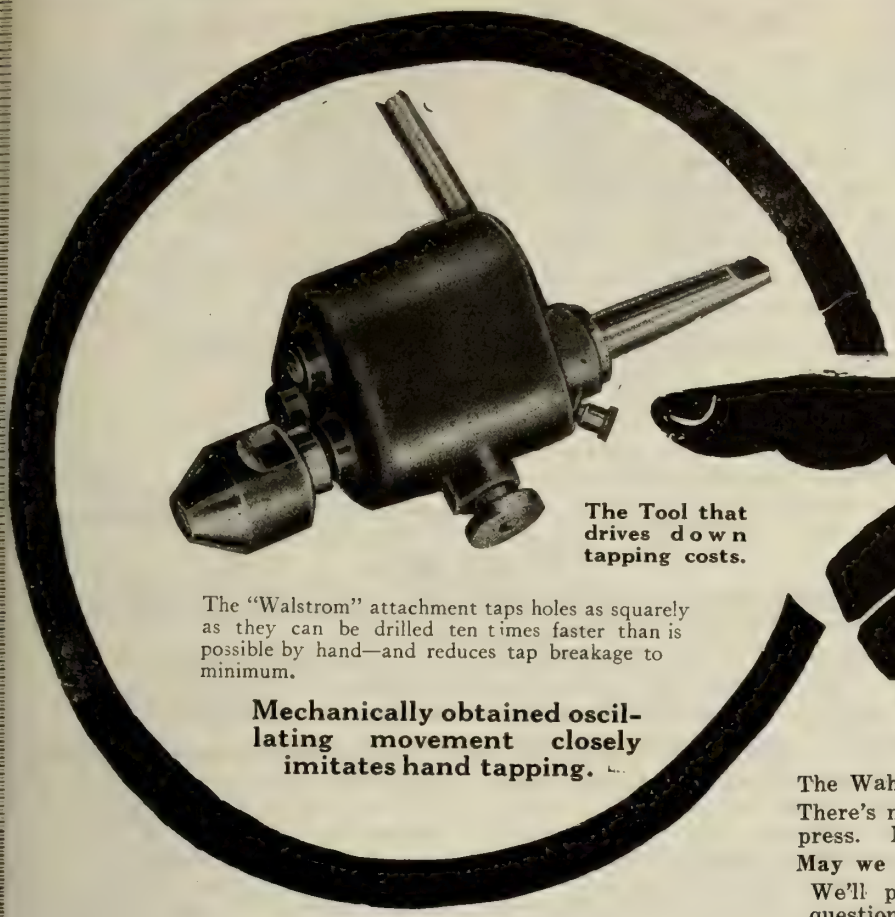
Numerous icebergs are reported along the coasts of Newfoundland and are proving a menace to Atlantic shipping. Last week the C.P.R. liner Grampian was seriously damaged, and several weeks in drydock will be required for repairs.

With the announcement that the steel plate mill at Sydney will be completed and the old contract fulfilled, we are almost assured of an extended period of shipbuilding activity. It would not be surprising to hear of additional ship contracts being let by the Government.

The Thos. Davidson Manufacturing Company of Montreal are building a large addition to their present plant on Delisle street, to take care of their rapidly increasing business. The grey iron foundry work has been discontinued at the main plant and a new modern foundry building, 100 x 74, is being constructed at Turcot, adjoining the steel plant of the company.

The Jas. Buckley Co. of Montreal have obtained the exclusive Canadian agency for the Mahrvel line of oil furnaces and blow torches, manufactured by the Mahr Manufacturing Company of Minneapolis, Minn.

The French gunboat La Somme, after some strenuous patrol duty off the banks of Newfoundland, is paying a visit to Montreal, and will participate in the celebration that is being held this week, to commemorate the fall of the Bastille. The vessel is one of 800 tons displacement, fitted with twin Parsons geared turbines and capable of 20 knots.

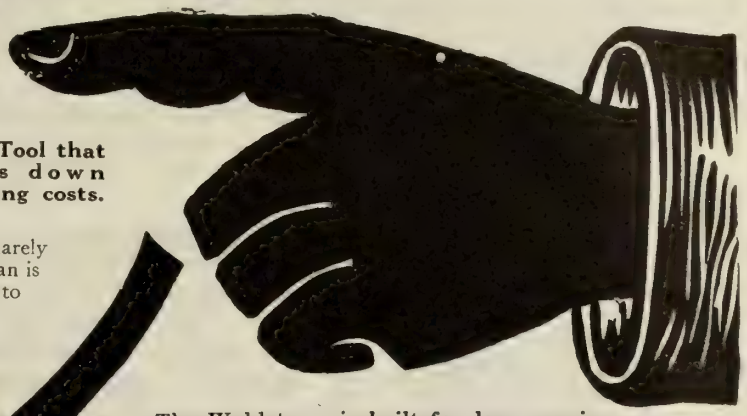


Aikenhead's Wahlstrom Attachment

The Tool that drives down tapping costs.

The "Walstrom" attachment taps holes as squarely as they can be drilled ten times faster than is possible by hand—and reduces tap breakage to minimum.

Mechanically obtained oscillating movement closely imitates hand tapping.



The Wahlstrom is **built for long service.** There's nothing to get out of order. Fits any drill press. Makes taps of all sizes up to ½-inch.

May we send one on trial?

We'll promptly refund your money without question, if you are not satisfied.

Aikenhead's Starrett Tools

The Best That Money Can Buy

A knurled licking nut contracting a split bushing around the spindle tightens and keeps the spindle central and true, or by a slight turn licks it firm, making a solid gauge when desired. Anvil and spindle are hardened, ground and lapped.

Send for bulletins.

Starrett Micrometer Calipers have a more exact and easier way of adjustment than by the old method of a movable anvil. Over the barrel is a thin, graduated sleeve, and on this sleeve is the zero line, instead of on the barrel itself. The thin sleeve keeps dirt from the screw and after years of use a turn of this sleeve brings the zero line correct to

Compensate for Wear

AIKENHEAD HARDWARE, LIMITED

17 Temperance St., Toronto

She was fully armed during the war, but is now reduced to one gun forward.

On and after July 1st, the firm that has been known as H. Boker and Co., Inc., Canada, will be conducted under the name of the Pilot Steel and Tool Company, Limited. The new company will be operated as a distinctly Canadian corporation but will continue to be affiliated with H. Boker Co., of New York, representing the latter in Canada. The Pilot Steel and Tool Co., as the Canadian representatives of the New York firm, will act as sole agents in Canada for the entire optput of Jonas and Colver, Ltd., of Sheffield, England, makers of Novo Superior high speed steel, Novo high speed steel, Intra steel, hot and cold rolled tool steel, circular saws, planer knives, files, etc. All the other lines formerly handled by the old company will continue to be stocked by the new company. The directorate of the new company will be practically identical with that of the old concern. F. E. Rejall who has been Canadian manager for a great number of years, will henceforth act as vice-president and director, and continue the management as heretofore.

As an instance of the ability of ships built on the Isherwood system to resist severe strains, the case of the oil tanker "San Zeferino," is typical. This vessel sunk after being holed in the engine room, which was right aft. Her stern sank in 90 feet of water, till her sternpost rested on the bottom, but the buoyancy of her oil cargo, kept the fore part up so that her fore foot was out of water. She remained in this position for a month before being floated, when a good portion of her oil cargo was salved in perfect condition, and the hull was in an absolutely unstrained condition.

An account of a dry dock for which patents are pending comes from the United States which reads like a fairy story. It is said to be the product of ten years' engineering study. The new dock will, it is said, have a speed of 42 knots per hour, and will be able to go to sea and relieve vessels in distress as well as perform the usual functions of a dry dock. It will be fitted with cranes and winches which will enable it to grapple with and raise any vessel existing. No details are given as yet, but they will be looked for eagerly.

Special Announcement

A FEW weeks ago we asked readers of CANADIAN MACHINERY, especially those engaged in the study of our Drafting Course, to state their views regarding the suspension of this course until Sept. 1.

So far the majority of letters suggested the plan of stopping work until this date, when the weather would be cooler. There are other students who unfortunately did not send in their views, so we must, for the present at least, follow the plan of closing the course until the fall.

Following are the winners for Plates Nos. 4 and 5. Later we will announce the winners for Plates 6 and 7. Should students desire a continuance of the course, without this vacation, so to speak, our only method of knowing their mind is by receiving letters, so be governed accordingly.

ANNOUNCING THE PRIZE WINNERS

PLATE No. 4

Hugh Scott, 27 Helena Ave., Toronto, Ont.
Wm. Williamson, 10 Crombie St., Galt, Ont.
Thos. Dunbar, 115 Proctor St., Sarnia, Ont.

NOTE.—Hugh Scott has now landed his second prize. Former winners, get busy after Sept. 1st, and land some more prizes.

PLATE No. 5

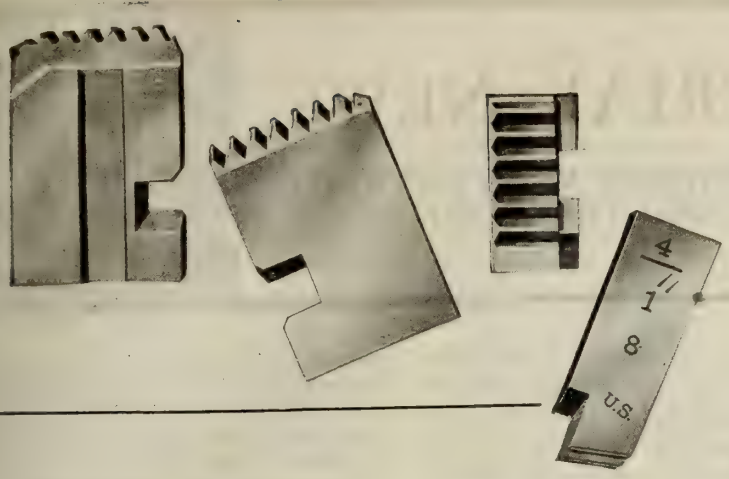
Leonard Snary, 170 E Superior St., Chicago, Ill., U.S.A.
David Winton, 95 Cedar St., Galt, Ont.
Joseph Wenzel, 438 Franklin Ave., Hartford, Conn., U.S.A.

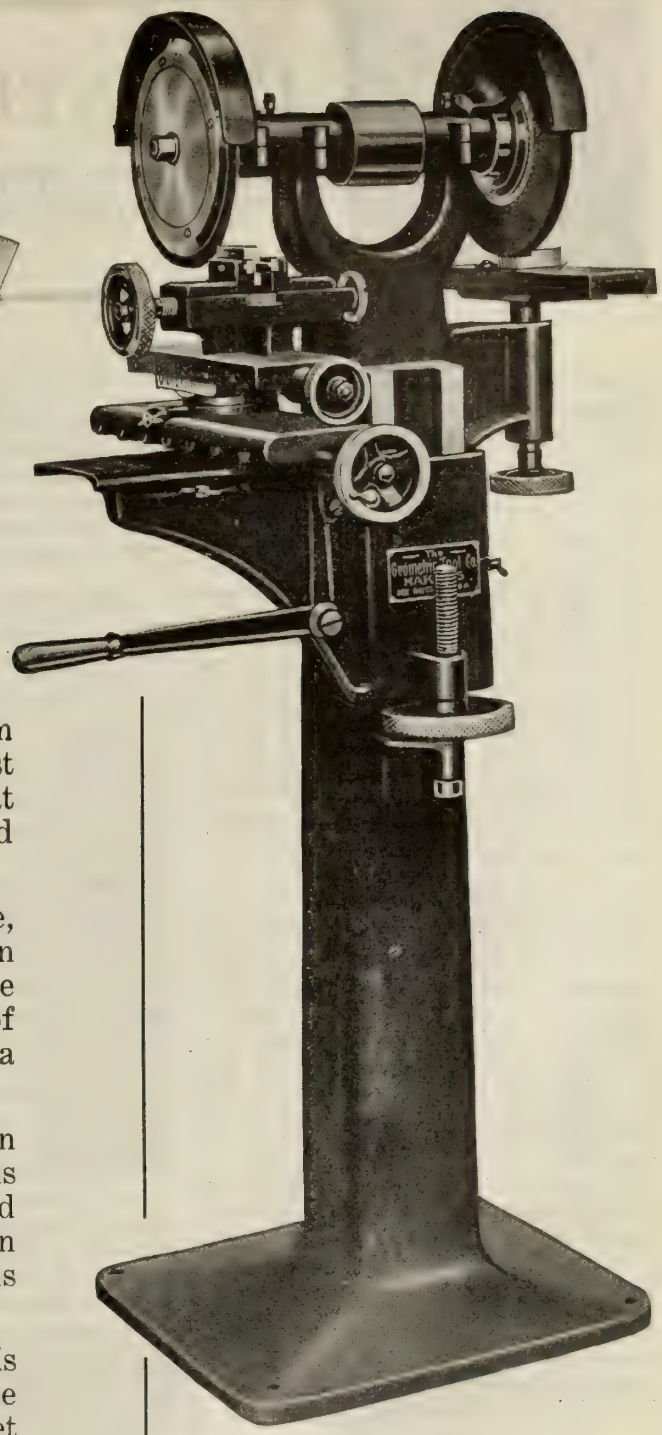
NOTE.—Two prize winners are from the land of Uncle Sam, showing that CANADIAN MACHINERY is well read, and distributed.

Current Events in Photograph

First Dirigible to Cross Atlantic

The photo gives a good idea of the great size of the R34. It was taken shortly after the explosion which tore the dirigible from her moorings. The explosion was caused by the gas in one of the front sections becoming heated by the sun. It tore a section of the outer skin thirty feet long from the forward lower surface of the gas bag. This accident has delayed the return trip of the huge aircraft. But it is now on its way, having left Wednesday at midnight.





Sharp Chasers Cut Clean Threads

Accurate, uniform threads result only from dies which are maintained in the highest state of cutting efficiency. This means that chasers must be kept sharp, and ground uniformly.

Even if just touched up from time to time, the chasers respond splendidly, with clean threads. And with this machine — the Geometric Chaser Grinder—the matter of keeping threading tools up to scratch is a comparatively simple matter.

Various makes of chasers can be ground on this adaptable machine. The two wheels permit the easy grinding of both milled and tapped chasers. In addition, the plain wheel lends itself readily to various kinds of tool grinding.

Uniform grinding of a set of chasers is purely a mechanical matter through the use of adjustments which can be accurately set to govern the grinding of an entire set of chasers.

The Catalog describing this machine is a mine of information on chaser grinding. Write for it.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

MUNICIPAL

The Kempsmith Manufacturing Co., Milwaukee, Wis., has issued a new general catalogue, descriptive of Kempsmith milling machines. This catalogue is composed of four-page circulars, each complete in itself.

Toronto.—The Dominion Shipbuilding Co. launched their seventh ship in the past nine months last week. This was the steamer "Hessa," a full sized freighter of 3,650 tons deadweight. Her dimensions are 261 feet by 43 feet 6 inches, by 24 feet 2 inches; her engines of the triple expansion vertical type, being designed to develop 1,200 h.p. She is fitted with two Scotch marine boilers, working at 180 lbs. per sq. in. steam pressure. The Dominion Shipbuilding Co. have orders for five more steamers to be delivered this Fall and next Spring.

St. Catharines.—The St. Catharines Journal says, in a recent issue: "When Mr. Gaby, chief engineer of the Hydro-Electric Commission,was before the City Council a week or so ago, he stated in reply to quotations furnished by Mayor Elson and Alderman Riffer, that the Commission could buy steel rails to-day at $40 to $45 per ton. The above two members of the council, who had prices on such materials, said their information was that rails cost from $55 to $65 today. A copy of the Daily Iron and Metal Trade newspaper, just to hand gives a report of the bid of an United States firm on a shipment of 5,000 tons No. 1 steel rails for Glasgow as $87 a ton. It adds that this was $8 per ton below the lowest British bid. In view of such prices prevailing in the United States the price quoted by the chief engineer of the Hydro is all the more mystifying."

TRADE GOSSIP

Major A. GG. Hutter has taken up the management of the Montreal office of the firm of Wonham Bates & Goode, Inc., New York and London, exporters and importers. Previous to going overseas Major Nutter was connected with Mussens, Ltd.

Plant Closes.—The plant of the Brunner Mond Company at Amherstburg has been closed down, to stay so until labor conditions become such that business can be carried on. The plant, which is a subsidiary of the Solvay Process Co. of Detroit and Syracuse, is the largest in this country. Several hundred men are affected by the unexpected development.

Ready for Operation.—Canadian Engines, Ltd., manufacturers of stationary and portable gas and gasoline engines, grain grinders and saw frames, who were practically closed down during the war, have resumed operations, and are taking on a full complement of men. They report an abundance of business in view and that the prospects are favorable for a busy time throughout the year.

Tanning Company Extends.—Advices from Kitchener, Ont., state that the Lang Tanning Company, one if the pioneer industries of the city, will make a considerable addition to its plant. This will consist of two buildings each 100 by 200 feet, four-storey brick construction. The present staff, which numbers about 200, will be increased to 300 and possibly more when the new buildings are ready.

Britain's Lumber Requirements.—The enormous quantities of timber required for the British Government's new housing program, is being mostly supplied from Baltic sources. The rates on Canadian lumber, always higher than those from Scandinavia, are now in the proportion of three to one. The whole question is one of shipping facilities, and if Canada could solve these difficulties, she would have a chance of competing with the Scandinavian countries.

New Power Plant.—A huge power plant is being constructed on the Winnipeg River at DuBonnet Falls, 75 miles north of Winnipeg. The Winnipeg River Power Company, backed by Mackenzie & Mann interests, are the owners. The ultimate capacity of the plant will be 168,000 horse-power, in six units of 28,000 each. The development will take three years, and will cost $700,000.

Ship Plate Agreement.—An important decision was made for the Dominion Steel Corporation when the Government decided to renew the plate contract at a reduced price. This is not only helpful to the company itself, but will naturally help the immediate district, and, indirectly, the whole country. The amount of money involved is in the neighborhood of $4,000,000. It may also mean the continued building of ocean-going ships in Canada, as the fact of being able to obtain plate in Canada should materially bring down the building cost.

Industrial Convention.—The forthcoming Industrial Convention in Alberta shows promise of being a great success. More than 150 American Chambers of Commerce have written signifying their intention of assisting in the good work, any many of them are sending delegates. The congress will be held in Alberta from Aug. 11 to 16, with special sessions in Calgary Aug. 13 and 14. Congress headquarters are at Pallisser Hotel, Calgary.

To Attend Athens Fair.—The fair at Athens, which commences on October 13th, will contain exhibits of Canadian manufactured goods. This is the result of Mr. Lloyd Harris's efforts to interest Canadian manufacturers in the possibilities of the Balkan markets. One of the methods of placing the goods before the visitors to the exhibition is by photo, and a large number of these have been sent. The invitation to attend came through the Federation of British Industries. The Canadian Manufacturers' Association has a representative who is interviewing all manufacturers whose goods might be suitable for the Balkan trade.

Trade Commissioner's Views.—The Canadian Trade Commissioner from Manchester, England, has been visiting Toronto, and has some interesting things to say anent the prospect of trade with Great Britain. He states there will be a good market for Canadian manufactured goods and raw materials in the Old Country for the next three or four years, and gave instances of orders recently placed by English firms in Canada. He mentioned a half million dollar order for confectionery placed by a Manchester firm in Canada, besides huge orders for rivets, wire nails and wire. There is a hosrtage of three-quarter million homes in Great Britain, and enormous quantities of windows and doors would be required.

New Steel Appointments.—Two important appointments are announced by the Dominion Steel Corporation. Mr. Roy M. Wolvin has been elected a director to fill the existing vacancy on the board, and his expert knowledge of shipping should make him a valuable adviser. Mr. Wolvin has been identified with lake shipping for a considerable period. He was president and general manager of the Montreal Transportation Co., and later vice-president of the Halifax Shipyards, Ltd. Mr. H. J. McCann has been appointed assistant to Mr. Mark Workman at the Montreal offices. Mr. McCann has advanced to his present position through various departments of the steel company, with which he has been identified for some years, entering its services as a telegraph operator.

Vancouver Terminals.—In connection with the construction of the new barbor terminal facilities at Vancouver, Mr. McClay, Harbor Commissioner, states that an effort will be made to have the terminals built entirely by veteran labor. He says that with returned soldiers the work can be done better, quicker and cheaper than by the employment of contract labor. In support of this contention he instanced the construction of Industrial Island under the Crafton Street Bridge, on which the Harbor Commissioners saved 10% of the cost. From the ranks of the Canadian Engineers, who had overcome such grave difficulties in France, Belgium and Palestine, men could be found to fill all the technical positions, as well as the rank and file.

Serious Coal Shortage.—A number of circumstances are combining to make the coal situation a serious one. Labor troubles and transportation difficulties aer the chief of these. The production of bituminous coal for the six months of this year was approximately 212,000 000 tons, which is 700,000,000 tons less than for the corresponding period last year. As the estimated requirements for the year are 560,000,000 tons, much greater production will be required for the ensuing six months to make up the average. This is unlikely to be achieved, as the labor force at the mines is about 10% below last year's. Add to this suspension of labor due to wage negotiations which are pending, and the prospects of a serious shortage cannot be denied.

Norton Changes—The business of the Norton Grinding Co. of Worcester, Mass., has been merged into that of the Northern Co. The name of the Grinding Co., associated with the Precision metal grinding machine, will disappear entirely. Besides the large foreign selling force, arrangements have been made to open branches in Norway and Sweden. A new store has also been established in Detroit. Officers of the new company are: George I. Alden, chairman of the board; Charles L. Allan, president and general manager; Aldnans C. Higgins, treasurer and general counsel; George N. Jeppson, secretary and works manager; W. LaCoste Neilson, vice-president and foreign manager; and Carl F. Dietz, vice-president and general sales manager. Formal announcement was made of the establishment of a factory in Japan and foreign sales agencies in several foreign countries which Mr. Neilson has frequently visited during the last few years and with whose conditions he is personally familiar.

MARINE

Ottawa.—Besides the six ships of the new Canadian Government marine already launched, it is expected that thirty more will be completed this year. The remaining vessels will be completed before the end of 1920.

London.—Sir Auckland Geddes, Minister of National Service and Reconstruction, in reply to a question in the House ofCommons, stated that the Government had made a profit of approximately £10,000,000 from premiums on shipping war risks insurance.

Port Arthur.—The contract for the new break-water to be built this year has been awarded to Chambers, McQuigge and McCaffrey Company of this city. Arrangements are being made to commence the work immediately. The Thunder Bay contracting company has secured the contract for the revetment wall at Fort William, and have already started operations.

Ottawa.—A start will be made this year on the construction of a new dry dock at Esquimalt, the total cost of which will be $400,000. The amount to be expended this year will be in the neighborhood of $500,000. Other harbor works for which money has been voted include Champlain Dry Dock, Quebec; River St.

London.—Robert Houston, M.P. for Liverpool, and himself a large ship-owner, called attention in the House of Commons to the threatened competition of the U.S. in the shipping trade, and asked in view of the sacrifices made by British ship-owners during the war, whether the Government would make diplomatic representations to the U. S. with the object of preventing competition and friction between the two countries. Col. Wilson, the parliamentary secretary of the Ministry of Shipping, in reply, stated that all possible steps would be taken to protect British shipping, but could not assent that the question of American competion was one for Government representation to the Government of the United States.

The City of Belleville requires tenders for the construction of Sanitary Sewers. Tenders to be delivered up to July 18th. Plans and specifications can be seen at the office of the City Engineer.

The Department of Public Works are offering for sale a 70-ton "Bucyrus" steaf shovel an ten dump cars, situated at Booth Street Yard, Ottawa. The material can be seen at this address between 7 a.m. and 5 p.m. on application to the Superintendent of Dominion Buildings, Ottawa. Tenders will be received up to July 21st.

Tenders addressed ti H. F. McNaughten, Secretary of Public Works, Ontario, will be received up to July 21st for an extension to Macdonald Hall and for a piggery, in connection with the Agricultural College, Guelph, Ont. Plans and specifications can be seen at the Bursar's office, Agricultural College, Guelph, and at the Department of Public Works, Toronto.

INCORPORATIONS

The Canadian Aero Co., Ltd., has been incorporated with head office at Brantford and a capital stock of $50,000, divided into 500 shares of $100 each, to establish a general aircraft service, carrying passengers, mail and freight.

A company has been incorporated with a capital stock of $24,000, divided into 240 shares of $100 each, and known as the Canadian Type Registering Scale Co., Ltd., with head offices at Hamilton, to manufacture scales and type registering devices.

The Premier Paper Products, Ltd., has been incorporated with head offices at Sarnia, Ont. The capital stock will be 650,000 in 500 shares of $100 each. The object of the company is to manufacture and deal in paper cardboard and other products of paper or pulp, and engage in a general lumber business.

The Canada Petroleum and Refining Co. has been incorporated with head offices in Toronto. The capital stock of the company is to be $2,500,000, divided into 2,500,000 shares of $1 each, and the object of the company is to carry on a general business in crude petroleum and its products.

PERSONAL

The Seneca Falls Manufacturing Co., Inc., Seneca Falls, N.Y., have issued a booklet on the quality and precision lathes manufactured by themselves. This publication lists the various sizes and kinds of "Star" and screw-cutting engine lathes.

Power Press Bargains

Partial Selection from our Big Stock:

3—Used FERRACUTE D-201 Vertical Double-geared Straight-sided Single-action Redrawing Presses, having capacity for exerting pressure of 200 tons. Length of stroke, 10″. Distance between columns, 32″.

1—Used FERRACUTE D-151 Vertical Double-geared Straight-sided Single-action Redrawing Press, exerting 150 tons pressure. Length of stroke, 13″. Width between columns, 32″.

6—Used FERRACUTE DGG-56 Vertical Double-Geared Straight-sided Single-action Redrawing Presses; 5 of these presses have 18″ length of stroke and 1 has 20″ length of stroke. Distance between uprights, 30″.

7—Used FERRACUTE DGG-56 Vertical Double-Geared Straight-sided Single-action Redrawing Presses, exerting 100 tons pressure; 6 of these presses have 15″ length of stroke and 1 has 12″ length of stroke. Distance between housing, 30″.

6—Used FERRACUTE DGG-55 Vertical Double-geared Straight-sided Single-action Redrawing Presses, exerting 75 tons pressure. Three of these presses have 15″ length of stroke and three have 18″ length of stroke. Distance between housing, 26″.

1—Used FERRACUTE C-5 Open-back Inclinable Cutting Press, Direct Belt Drive., that is, not geared, having capacity for exerting about 50 tons pressure. Length of stroke 2″. Distance from centre of ram back to frame, 12″. Width of opening through back, 18½″. Height of opening through back 7½″.

3—Used FERRACUTE PAG-4 Geared Adjustable Bed Punching Presses, having capacity for exerting 50 tons pressure. Length of stroke, 2″. Distance from centre of ram back to frame, 8½″.

3—Used FERRACUTE PA-3 Adjustable-bed Punch Presses, not geared, having capacity for exerting about 35 tons pressure. Length of stroke, 2″. Distance from centre of ram back to frame, 7″.

1—Used BROWN-BOGGS No. 215 Inclinable Power Press. This is a geared press. Arranged with 24″ x 6″ pulley. Distance back from centre of slide, 9½″. Distance from bed to slide, when up, 13¾″. Width between gibs, 11⅞″. Length of stroke, 4″.

7—Used FERRACUTE D-45 Horizontal Double-end-Screw Press designed for deepening or redrawing sheet metal tubes and shells about 3″ diameter and 18″ deep. Capacity for exerting 100 tons pressure. Three of these presses have length of stroke of 36″ and 4 have length of stroke of 40″. Diameter of ram screw, 6½″. Diameter of side rods, 5″.

2—Used E. W. BLISS No. 60½ Vertical Geared Rack-driven Presses. Length of stroke, 36″.

3—Used FERRACUTE E-57 Vertical Geared Toggle Coining Presses. Length of stroke, 3″.

5—FERRACUTE E-56, Vertical Geared Toggle Coining Presses. Two of these machines have 3″ length of stroke and 3 of them have 2″ length of stroke.

4—Used No. 666 Vertical Geared Toggle Presses, manufactured by the TOLEDO MACHINE & TOOL COMPANY. Having 2¼″ length of stroke and capacity for exerting 1,000 tons pressure on ram.

NOTE:—The above presses were all operating on manufacture of Cartridge Cases when work stopped about nine months ago. They were purchased new from manufacturers from February, 1915, to September, 1915, and have had about two years' service. They were not used continually since being purchased. Some have been repaired and all have been kept in good running order—Examination can be made in Montreal.

TERMS:—25% with order balance against Bill of Lading.

NOTE:—If these presses were to be shipped back to the United States there would be no duty to be paid—You would only require to add freight from Montreal to destination (except Brown-Boggs Press).

HAMILTON ∴ ∴ CANADA

-And I Always Thought That Was A Good Tractor-

Some little part gave way and his Spring plowing was delayed for a couple of days. His good opinion of your tractor is gone forever; others will hear his tale and your distributor in that territory will fall two or three short of selling as many of your tractors as he would have sold if it hadn't been for that defective part, defective because it was improperly heat-treated.

It makes no difference whether you manufacture tractors or other machines or machine parts, unless you have the **right** heat-treating furnace the reputation of your product is in constant jeopardy.

You Cannot Afford to Take Such Chances

GILBERT & BARKER Heat-Treating Furnaces

insure uniform high quality of produce because they are designed right and built right. The combustion in a G. & B. Furnace is 100% efficient, temperature control is one of the big features, the heat is uniform **always**, the result is a finished product of maximum tensile strength which will stand up under the hardest usage.

The operating cost of G. & B. Furnaces is extremely low.

Send for Bulletin 24. Let our Engineers suggest the furnace that is best suited to your requirements.

To-day is a better day than to-morrow—write.

PUNCH PRESS WORK

What Can You Save?

By Using Parts Made in the Punch Press

Look over your standard parts, Mr. Manufacturer, and see what parts can be made (or could be made by slight change in design) by this process.

You will be surprised at the saving you can effect.

We make Blanking, Perforating, Drawing, Forming and all classes of dies and tools for plain or difficult stamping to suit the production required.

A Battery of presses is also available at our plant to manufacture parts for you with the understanding that you pay only for good parts made. Our facilities ensure prompt deliveries at right prices.

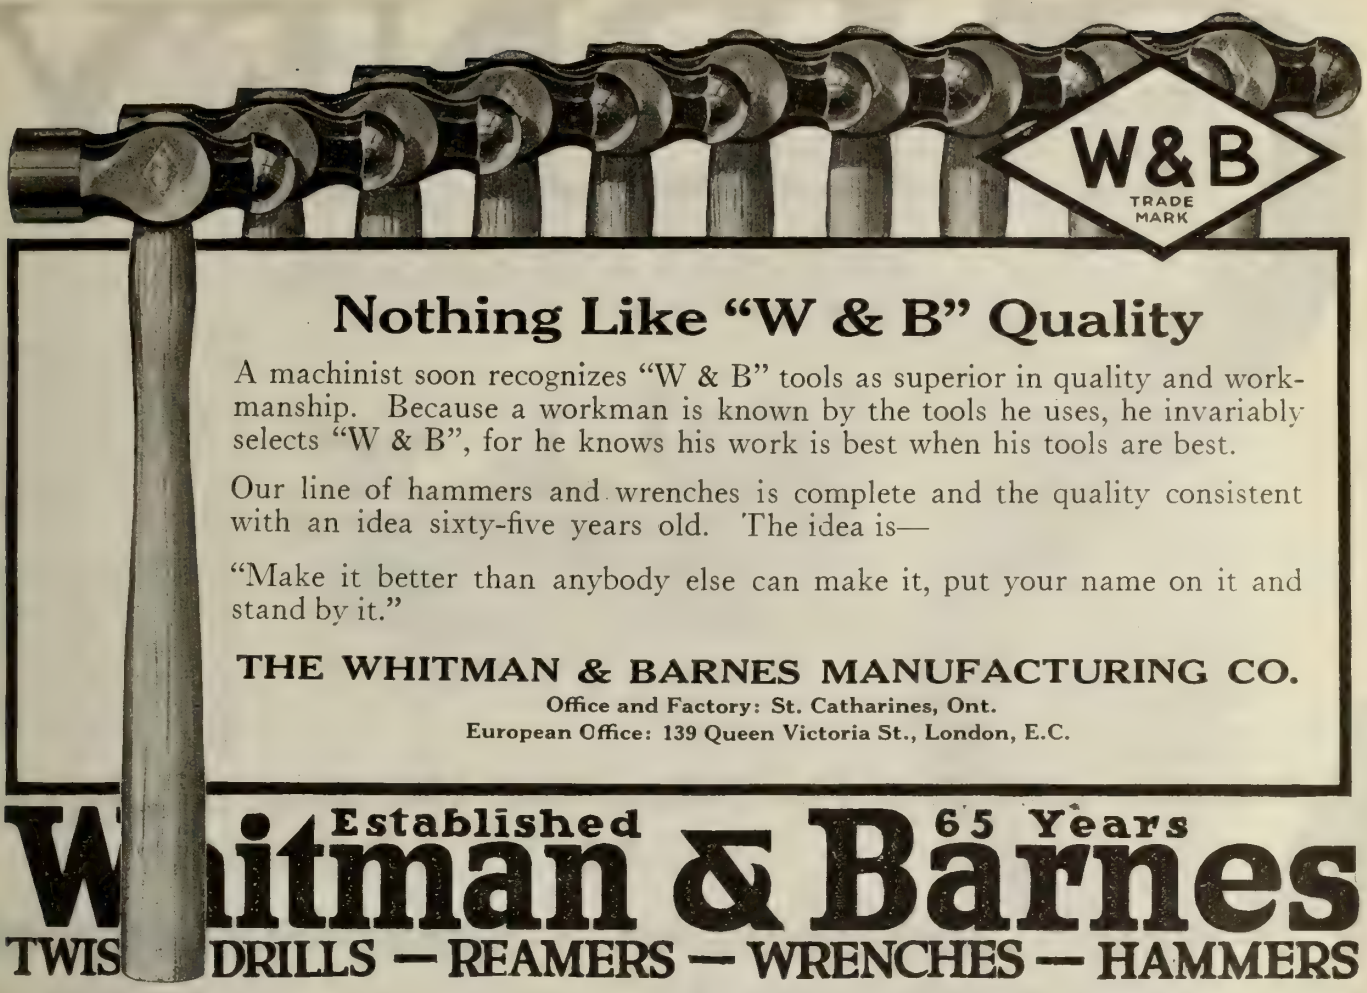
370-386 PAPE AVE., TORONTO.



Nothing Like "W & B" Quality

A machinist soon recognizes "W & B" tools as superior in quality and workmanship. Because a workman is known by the tools he uses, he invariably selects "W & B", for he knows his work is best when his tools are best.

Our line of hammers and wrenches is complete and the quality consistent with an idea sixty-five years old. The idea is—

"Make it better than anybody else can make it, put your name on it and stand by it."

War Record Not Made Pu lic

The "Whitney" Special Quality "Type M" Chains

made a great showing during the war years 1916-17 and 1918.

Our tests and demonstrations were made on prominent 8-cylinder motors in service on a large number of cars in the State of Connecticut.

During this long period not a single "Whitney" Chain or Sprocket had to be replaced and the condition of every Drive has been pronounced remarkable.

One Drive recently examined had given over 35,000 miles' service and both Chains and Sprockets were in such perfect condition that they appeared good for more than double that record (Sprockets having no adjustment).

The links of this SPECIAL CHAIN have finished faces and reamed holes, and the smooth faces do not damage the Sprocket teeth.

Our war contracts were such that we did not announce this SPECIAL CHAIN until after the conflict was over.

THE WHITNEY MFG. CO.,

NATCO

DRILLING 38 HOLES OF DIFFERENT DIAMETERS IN ONE OPERATION

The above cut visualizes the great economical possibilities of NATCO Multi-Drillers.

This driller is one of many NATCOS installed in the plant of the Hinkley Motors Corp. It is drilling 38 holes of different diameters in one operation in the bottom of aluminum crank cases.

A patented feature of the NATCO, Independent Change of Speed to each individual spindle, permits drills of various sizes to be driven at approximately their correct cutting speed.

We also design and build jigs and fixtures for use in connection with NATCO Multi-Drillers.

LET US MAKE YOU PRODUCTION ESTIMATE ON YOUR WORK.

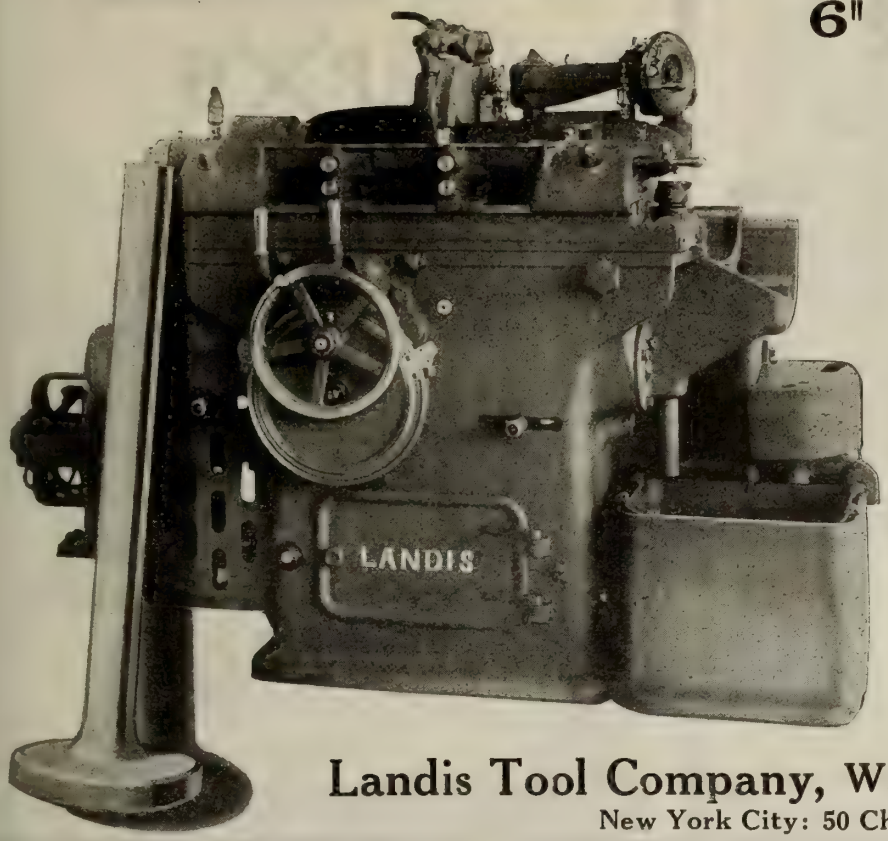
140 Valve Stems per Hour on the "LANDIS" 6" x 18" Grinding Machine



ONE enthusiastic user calls this tool "the biggest little machine on the market." It is a great little producer, compact, sturdy and accurate.

The stems of these valves require finishing within .00025" limits. The Landis does this easily, using a 4-inch face wheel requiring a traverse of only 3/8" to cover the stem and at a speed of 140 valve stems per hour.

Landis Tool Company, Waynesboro, Pennsylvania

Oxy-Acetylene Welding and Cutting

Making Sheet Metal Chemical Tanks by Prest-O-Lite Process

"Rivetless" Metal Joining Makes Tanks Leak-Proof

HERE is shown how permanently leakproof sheet metal tanks are made by the Prest-O-Lite process. The metal sheets are first cut to shape with a Prest-O-Lite cutting blow-pipe. They are then set in position, and all joints are welded by the Prest-O-Lite process of oxy-acetylene welding. The joints are made stronger, neater, and at less cost than by riveting. All danger of leakage at joints is eliminated.

In repairing as well as in manufacturing the Prest-O-Lite process is literally "blazing the trail" to efficiency and economy. It saves hundreds of thousands of dollars annually in Canadian factories, mines, machine shops—wherever metal or machinery is used.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Aceytlene is backed by Prest-O-Lite service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow-pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow-pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others It may suggest valuable ideas to you. Write for it.

gaging

measuring

"Just Right —without looking"

That's the point exactly. With Johansson Limit Snap Gages, the operator does not *need* to look. He can feel when the job is between the high and low limits of the snap gage. The "Go" gaging plugs pass over the work, the "No Go" Plugs will not pass over. So, without "reading" anything, he knows the job is "good enough" and will pass the inspector's Johansson Snap as readily as it did his own.

This is the limit system in actual operation. Not a thought of what the work measures. It doesn't matter, so long as it comes somewhere—anywhere between the limits.

When an operator uses a Johansson Limit Gage he does not waste time trying to work to "absolute dimension." He simply *gages* his job, keeping in between "Go" and "No Go." And if the limits have been established in the gages correctly, the work is sure to assemble without further machining or fitting. When a part comes out of a machine, it is finished.

To operate the limits system, you need Johansson Adjustable Limit Gages. Twenty-one sizes give all dimensions up to 12 inches. If you are in doubt, let one of our gage experts call upon you and explain.

Sharp Files Increase Men's Interest In Their Job

The man who uses a du file may work as har but he cannot work a well as the man with sharp file.

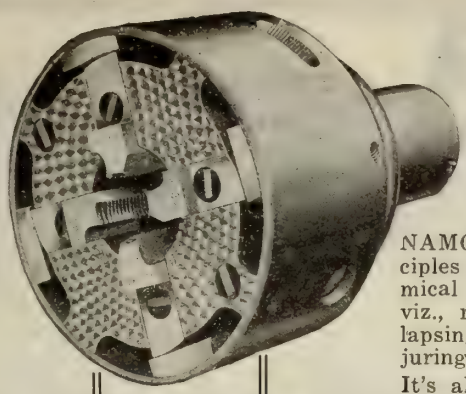
Tell your men to turn in dull file when they reach the "inefficier point."

"Famous Five" Files stay har and sharp because they are mad of good steel accurately cut an properly hardened.

Specify them when ordering.

They are:

DIES
SELF-OPENING



Simple
Few parts — easy adjustments — quick change of chasers — nothing complicated to get out of order.

Strong
Solid one-piece body.
Ample support of chasers.
Positive releasing and setting action.

Durable
All parts that are subject to wear are hardened and ground to a precise fit.

Made in Revolving and Non-Revolving types "for every threading requirement."

Quotations on request.

Send for a copy of the new NAMCO Tap and Die Book.

NAMCO

TAPS
COLLAPSING

NAMCO Taps embody all those principles essential to the rapid and economical production of clean-cut threads, viz., rigidly held chasers, positive collapsing, withdrawal of tap without injuring thread, and positive re-setting.

It's all in the construction.

Specific quotations on your work.

Capacities—⅞" to 5⅞".

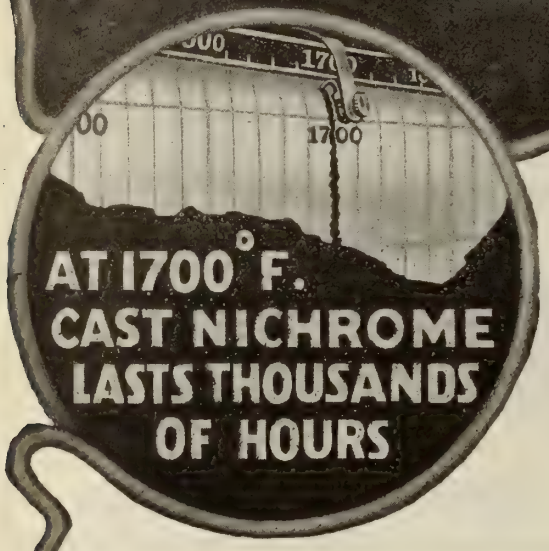
the Casting Durable

AT 1700° F.
TENSILE STRENGTH
24,500 LB. PER SQ. IN.



AT 1700° F.
CAST NICHROME
LASTS THOUSANDS
OF HOURS

Annealing and Carburizing Boxes of Cast Nichrome

Being much more durable at high temperatures, boxes made of cast Nichrome are superior to those of cast steel.

A steel box must be made thick to allow for the reduction of thickness caused by scaling or oxidation, each time the box is heated. The walls of a steel box, ¾ in. thick, will be only ¼ in. thick, or less, after repeated heating.

There is no loss with a Nichrome box, the walls are therefore made thinner, thus increasing the conductivity of heating.

Nichrome is cast in various shapes, and in any weight up to 1200 lbs. It is exceptionally adapted for annealing and carburizing pots, heating retorts, cyanide hardening pots, and lead tempering pots.

Write for further particulars. Manufactured under Henderson Patents.

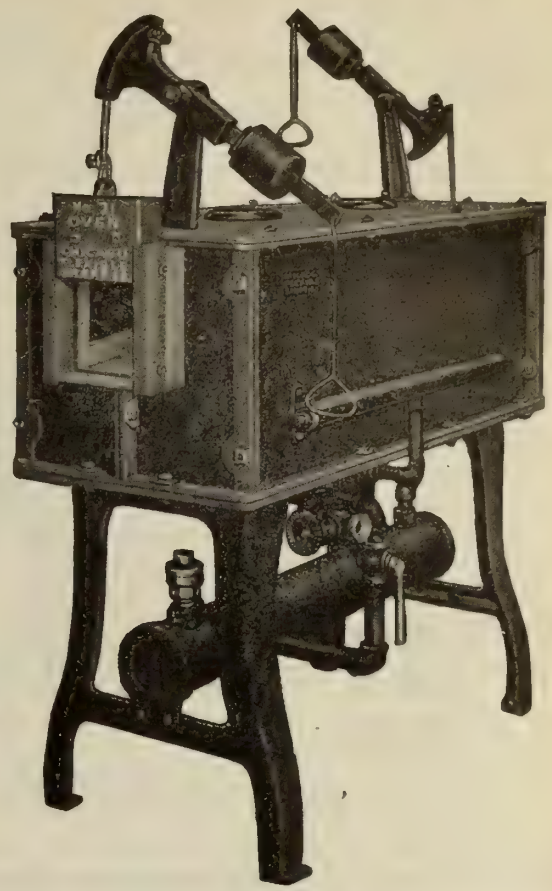
Heat-Control of Stewart Oven-Furnaces



War-taught lessons in scientific metallurgy abolished the "rule-of-thumb"–once for all.

The pyrometer, not the "wizardry" of the self-satisfied color-expert, is now in charge.

This new order-of-things calls for Heat Treating, annealing and carbonizing furnaces that permit of

Accurate Control of Temperatures

And Stewart Indirect-Heat Furnaces are equal to the most rigid requirements in this direction.

This control is partly a matter of scientific and accurate mixing of gas and air before it is admitted to the combustion chamber.

Partly due to the placing, spacing and direction of the non-carbonizing Burners used on all Stewart Furnaces.

Partly to the scientific relationship of chamber-area to port-hole areas.

Partly to the shape and position of Hearth.

Partly to the fact that the quality and thickness of our linings and the sturdy strength of our frames and casing all contribute to the permanent *tightness* of Stewart Furnaces.

All these, and many other features—in combination—place Stewart Furnaces in a class by themselves: recognized for their accuracy, dependability, and great endurance.

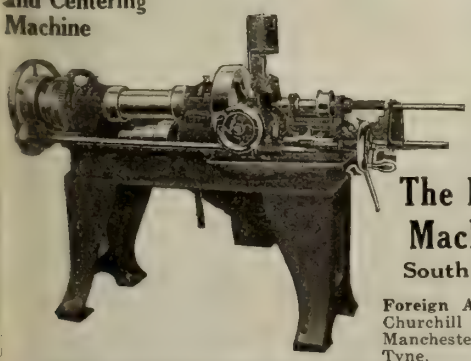
Hurlbut, Rogers Cutting-off and Centering Machine



Here's Real Economy

This patented Hurlbut, Rogers Cutting-Off and Centering Machine embodies two cutting-off tools—one cutting up and the other cutting down; each holding the work against the other. What is the result?—**the production is doubled and the cost is cut in half.** Further, the centering operation goes on at the same time. Doesn't this appeal to you as real economy in production? When you are assured of such good-paying results why hesitate to adopt this machine? Soon pays for itself.

Let us hear from you and we will give you the full story of its ability.

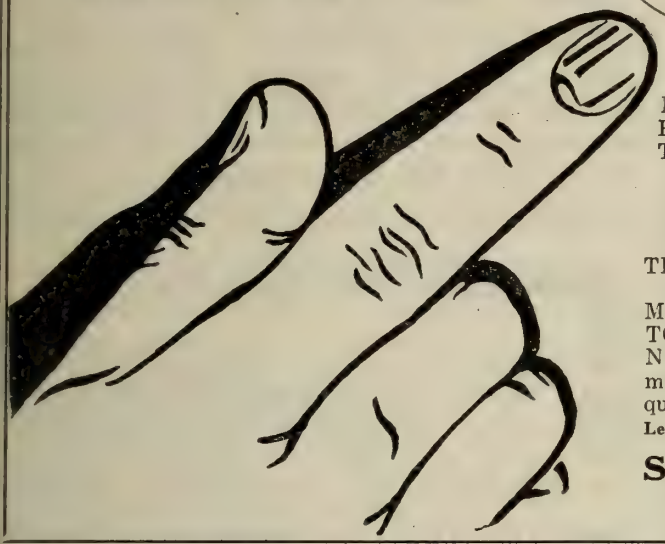
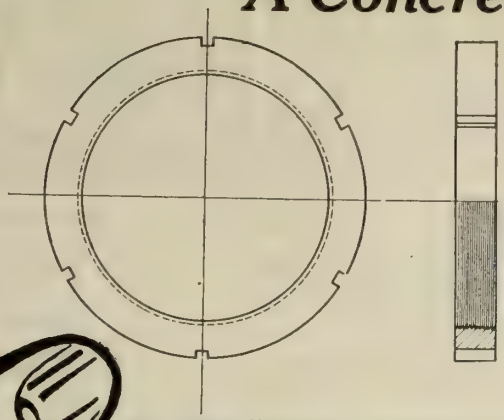
Smalley-General Thread Miller Saves Time on Main Spindle Nut Work



A Concrete Example



A vital factor in competition to-day is speed in production. You need the Smalley-General Thread Miller for quantity work. Speed, convenience and accuracy are the features of this modern cost-cutter. The following time-study illustrates what it will do:

MACHINE—Smalley-General Thread Miller No. 2.
PIECE MACHINED—Main spindle nut.
THREAD—Diameter, 8″; length, 1¼″; 8 pitch U.S. Standard.
1. Work chucked.
2. Threaded surface milled from rough.
3. One side faced.
4. Put on mandrel. Turn other face and outside.

TIME—Milling operation, 1 min. 45 sec. Milling feed, 14.3″ per min.
MATERIAL—Cast iron.
TOTAL TIME in thread miller, floor to floor, 3¼ min.
NOTE—Smalley-General Thread Miller Method involves no more chuckings than in a lathe and saves much time. Also quality of work better.

Let us tell you more about the "Smalley."

BOSTON, - MASS.

Alfred Herbert, Ltd., Coventry, England, London, Paris, Calcutta, Yokohama.

For Hardness Testing

THE PYROSCOPE

in shop and laboratory use the

Standard Scleroscope

Universally adopted; direct reading; inexpensive, and the only instrument that agrees with others of its kind in all parts of the world, thus solving problems of ordering materials to specification.

BOOKLET FREE.

THE SCLEROSCOPE (Set)

Heat Indication

by optical means is fast becoming the correct thing. The PYRO SCOPE has solved the problem.

Perfect constancy, inexpensive, no electricity used. Built to stand rough usage and upon common-sense lines. Used by the Government and best firms.

Shore Instrument & Mfg. Co. 555-7 W. 22nd St. New York

Agents for Canada: A. R. Williams Machy. Co., Ltd., Toronto, Can.

Trim Sail---Cut Down Your Fuel Cost

Fuel costs can be cut down in amounts ranging from hundreds to thousands of dollars, depending upon the size of the plant, by installing American Steel Split Pulleys. These claims are based on tests that can be verified or repeated for any responsible efficiency engineer who wants to know the truth about pulleys.
"Americans" are guaranteed for minimum belt slip, minimum air resistance, and for double belt-service.

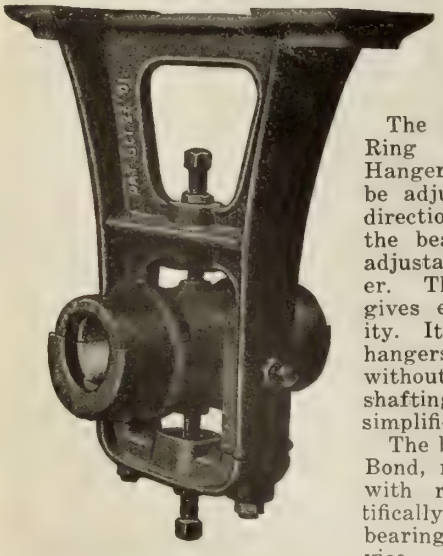
AMERICAN STEEL SPLIT PULLEYS

"American" Pulleys are made of the best wrought steel and are guaranteed as to material and workmanship. They are the only steel pulleys with grooved faces for air escape and are correctly designed for maximum strength and light weight. They will transmit more power with less waste than any other pulley on the market.
National distribution through supply houses from parent stocks in the larger cities.

THE AMERICAN PULLEY CO.
PHILADELPHIA, PA.

"Getting Maximum Pulley Efficiency" a valuable 37 page book on pulleys, free on request.

A *"Flexible"* Drop Hanger



The Bond Universal Ring Oiling Drop Hanger is designed to be adjustable in three directions. In addition the bearing proper is adjustable on the hanger. This combination gives extreme flexibility. It means that the hangers can be put up without considering the shafting. Installation simplified.

The bearing is of the Bond, ring oiling type with reservoir, scientifically a more effective bearing lubricating device. Reservoir needs to be filled every 6 to 8 months only. Maintenance minimized.

Send for our Catalog 38-CM. It will give you some new ideas on scientific power transmission specialties

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

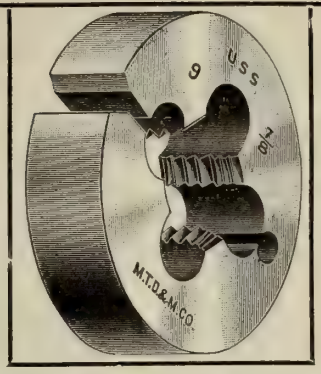
"MORSE"

TAPS & DIES



ARE UNEXCELLED FOR QUALITY AND WORKMANSHIP. THEY NOT ONLY CUT CLEAN, BUT ALSO HAVE THE "MORSE" DURABILITY.

ANY STYLE—ANY THREAD

MORSE TWIST DRILL AND MACHINE COMPANY

NEW BEDFORD MASS, U.S.A.

CLECO AIR HOSE FITTINGS

Valves, Couplings, Clamps, Nipples, Menders, Hose

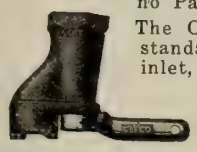
Everything required from "Pipe Line" to "Air" Tool

All Fittings Furnished are Interchangeable and Air-Tight

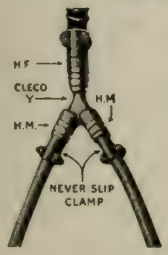
CLECO AIR-SEATED VALVES

The CLECO Air Valve has but three parts: Body, Valve Plug and Handle; no Packing required, has Waste arrangement.

The CLECO Valve, style P.O., is made in sizes ½-inch to 1½-inches, with standard pipe thread. Style F.O. is made in one size only; 1-inch pipe thread inlet, and ¾-inch Female Bowes Coupling Outlet and is interchangeable with Male Ends from ¼-inch to ¾-inch,



CLECO "Y" HOSE FITTINGS



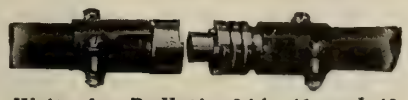
The Hose Section illustrated shows "Y" Fitting connected. The "Y" permits use of two Leader Hose Lines and Two Air Tools. Designed for Ship Yards use. Are made in four styles with Male or Female Outlets or Inlets and interchange with Bowes Male or Female coupling ends; sizes ¼-inch to ¾-inch inclusive. The two "Y" fittings illustrated are the plain style. The other two styles are each equipped with a valve having same features as Cleco Air Valves described above.

Y-Fittings may also be used in Boiler and Locomotive Shops.

BOWES AIR HOSE COUPLINGS

Standard Equipment Everywhere.

The Bowes is instantly connected or disconnected by ¼-turn.



The Bowes is absolutely Air-Tight under all pressures.

B-T THREAD LEAD INDICATOR

Be Sure You're *Right*—Then Go Ahead

Getting the right thread lead instantly, and maintaining a constant check upon it, minimizes the possibilities of delays in assembling and reduces the number of parts scrapped through incorrect measurements.

B-T Thread Indicators detect errors of one thousandth of an inch from correct lead. They are easily read—absolutely accurate—and can be used for testing odd pitches, as well as external and internal threads.

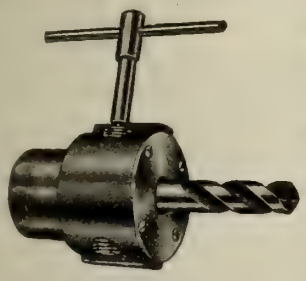
BICKNELL-THOMAS CO.

GREENFIELD, MASS.

Canadian Representative: The Jas. Buckley Co., St. Nicholas Bldg., Montreal, P.Q.

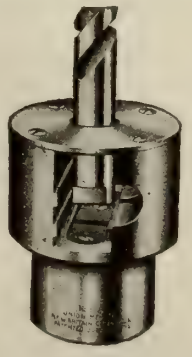
Have you a copy of our booklet?

UNION



POSITIVE DRIVE DRILL CHUCKS

The Union Drill Chuck is made in seven sizes (0 to 2 inches) with PATENT TRANSVERSE SLOT—so that drills with tenons can be inserted (see illustration). The shank of drill should be squared on two sides to enter the TRANSVERSE SLOT, giving a positive rotation to the drill independently of the jaws, permitting the jaws to centre and align the drill accurately. The drill is held absolutely true and will not slip under the hardest strain. This type of chuck will be found to give the best results on all classes of work from HIGH SPEED drilling to the hard BLACKSMITH and GENERAL REPAIR work.



UNION Manufacturing Co.

New Britain, Conn.

Makers of a complete line of chucks

A Suggestion

Williams' Superior Drop-Forged Wrenches

WHERE does your responsibility end? Do your wrench requisitions simply call for certain sizes of an unspecified design and make, or do you also demand *quality*—the quality that guarantees service?

For nearly half a century we have been manufacturing wrenches, creating designs, standardizing lines to meet various trade needs, testing our materials and processes in the effort to develop quality; in short, striving by every means in our power to maintain and improve that *Superior* something in our product which makes it individual and Williams'.

That this constant endeavor has been successful and is appreciated is evidenced by the many shops which *always* specify "Williams' Wrenches"—they want and insist upon obtaining *Superior* quality. Try this plan the next time you order.

Booklet describing 40 Standard Lines in nearly 1,000 sizes, with openings from 3-16" to 7⅝", sent on request.

The A. G. Low Co., Ltd., 45 Pacific Ave., Saskatoon, Sask. Agents for Manitoba, Saskatchewan, Alberta and British Columbia.

CUSHMAN

We've been Manufacturing

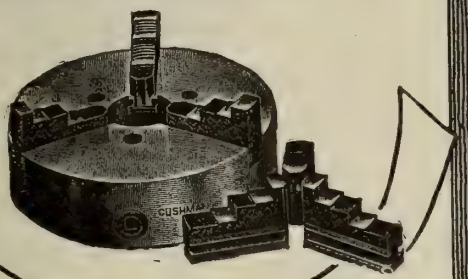
Nothing but Chucks and Their Accessories

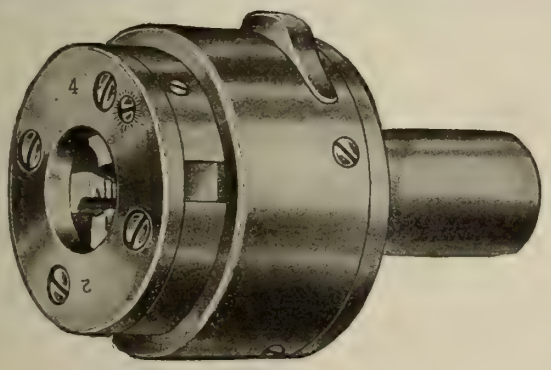
FOR NEARLY 60 YEARS

AND OUR PRODUCTS SHOW IT

Years of experience in using our tools has convinced manufacturers that the word "Cushman" stamped upon a chuck is a guarantee of its quality and efficiency.

Let us send you our catalogue.
Cushman Chuck Co., Hartford, Conn., U.S.A.





H & G Die Heads

are of small outside diameter compared with the size of work they do.

The H. & G. illustrated is an automatic, self-opening Die Head designed especially for use on Gridley and National Acme Multiple Spindle Screw Machines and others that use the die in a revolving position. The four sizes of this Head cut up to 9/16", 1", 1¼" and 1½".

All parts are hardened and ground and interchangeable. In a word—it's an H. & G.

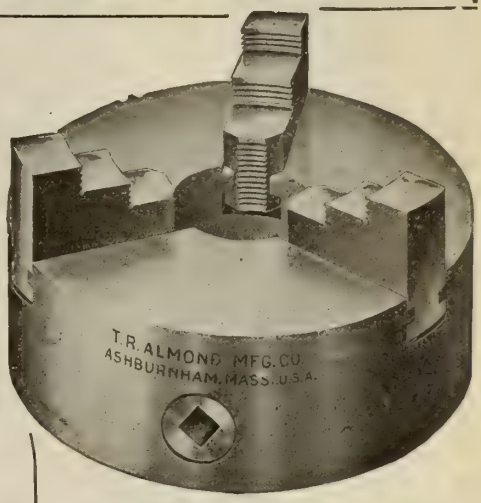
Ask for Catalog

Eastern Machine Screw Corp.

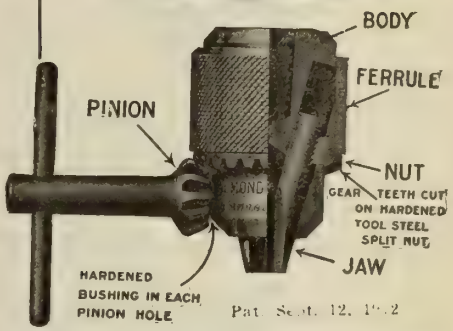
New Haven, Conn., U.S.A.

ALMOND CHUCKS & MICROMETERS

Give them a try out. Universal Geared Scroll Chuck—Sizes 5", 6", 7½", 9" and 12".



Geared Nut Drill Chucks, in various capacities, 0" to 1".

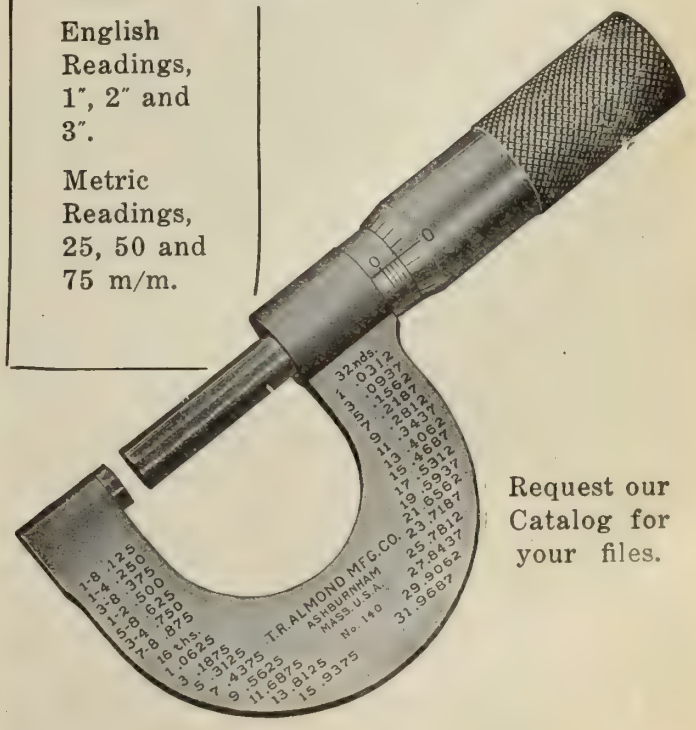


Pat. Sept. 12, 1911-2

Micrometer Calipers—

English Readings, 1", 2" and 3".

Metric Readings, 25, 50 and 75 m/m.



Request our Catalog for your files.

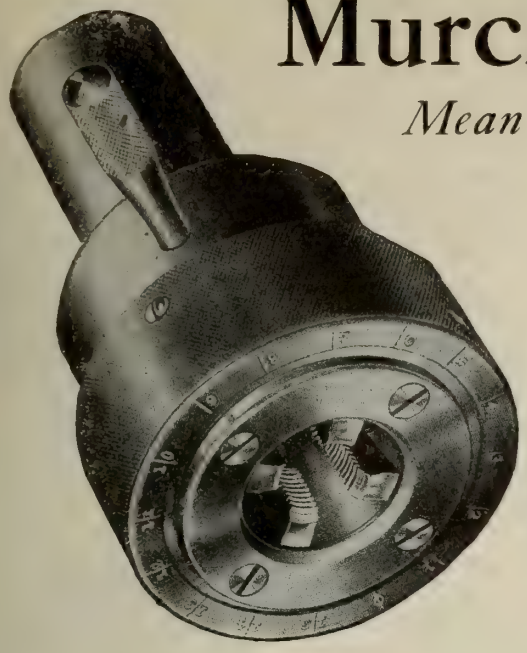
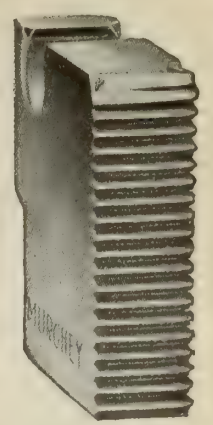
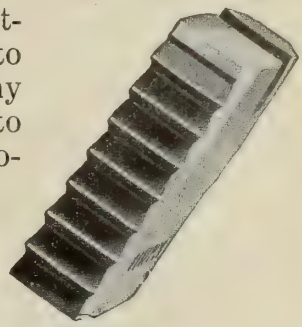
Murchey Chasers

Mean Quick Deliveries







Murchey Tools will cut your tapping and threading costs. **They will boost production 50%.** Another important feature is Murchey's **Quick Deliveries on Chasers.** This is a Murchey specialty. No waiting! We get your chasers to you when you want them. Why not use Murchey Tools to speed up your threading production?

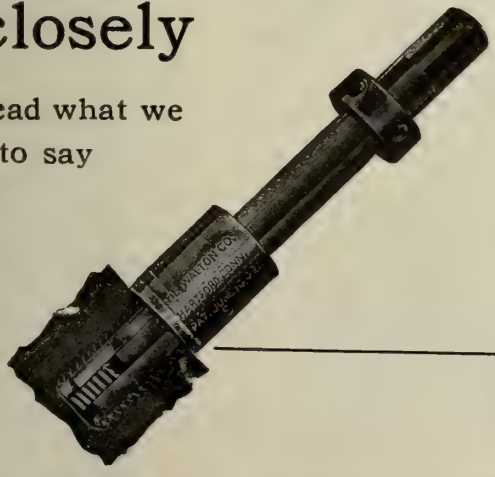
Send for a Murchey Tap or Die on approval and give it a trial. You will then secure actual proof of its value to you.

Murchey Machine & Tool Company, Detroit, Mich.

THE COATS MACHINE TOOL CO., Caxton House, Westminster, London, England, Glasgow, Newcastle-on-Tyne.
FENWICK FRERES AND CO., 15 Rue Fenelon, Paris, France.

Look at this again —closely

and read what we have to say below



WHEN a tap breaks off close or below the surface, you'll find the Walton Tap Extractor will save a great deal of time and trouble. The crucible fingers grasp the flutes of the tap, a twist of the wrench and the piece is out.
Don't you think it would pay to have a few lying around on your benches?

The Walton Company

Hartford, Conn.

Tools That Retain Their Keen Edges After Long Usage

The condition of Tap, Die and Reamer after long usage proves the stuff they're made of and determines their real value.

Try Butterfield and you'll say they're the cheapest in the long run.

Butterfield

Taps, Dies & Reamers

Butterfield Tools assure the utmost in accuracy and they take heavy cuts with an ease and speed that make the best material look soft.

Let us make you acquainted with them now by sending a trial order.

Boys, use these STOCO CELOGLAS SHATTER-PROOF LENS SAFETY GOGGLES

IT'S one of your most important duties to see that your workers in eye-hazardous positions are supplied with suitable eye-protectors. You cannot give them a better goggle than the Stoco safety goggle with Celoglas "Shatter-proof" lenses. It's a wonderful protection glass — staunch and durable and extremely comfortable in use. Your men will wear it willingly.

The Stoco safety goggle is made with easy cable earbows or with elastic headbands. The price with Celoglas lenses is $150.00 per hundred pairs; with heavy, clear optical glass lenses, $115.00 per hundred pairs.

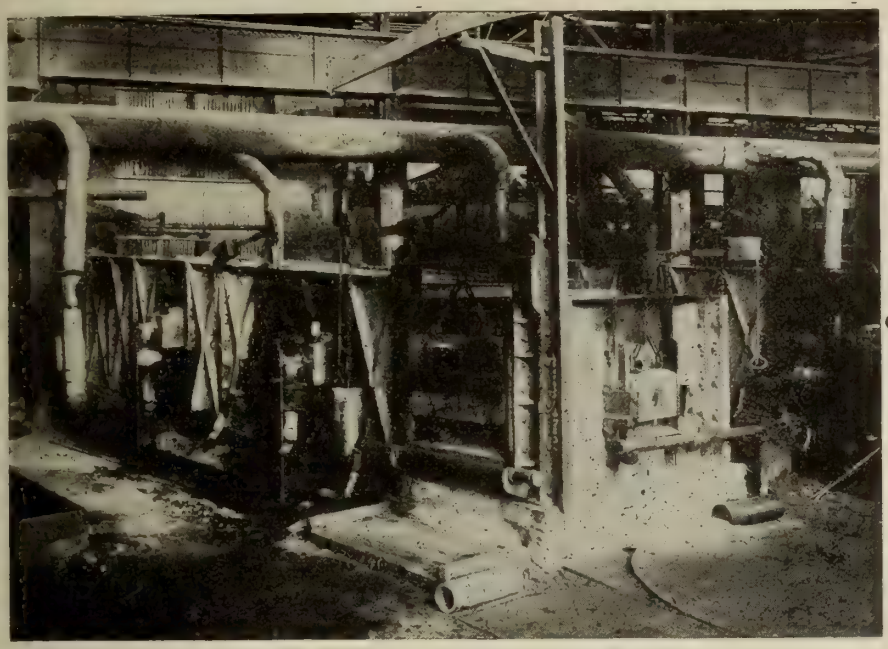
Another MECOL Furnace

demonstrated its superior features point by point to a group of men whose years of experience in the heat-treatment of metals made them appreciative judges. We refer to the "Mecol" Furnace shown in this illustration, installed at the Pointe St. Charles Works of the Canadian Steel Foundries, Limited.



Our intimate knowledge of heat-treating methods, and our long experience in the building of efficient furnaces fit us to give helpful advice—and that we will do promptly if you

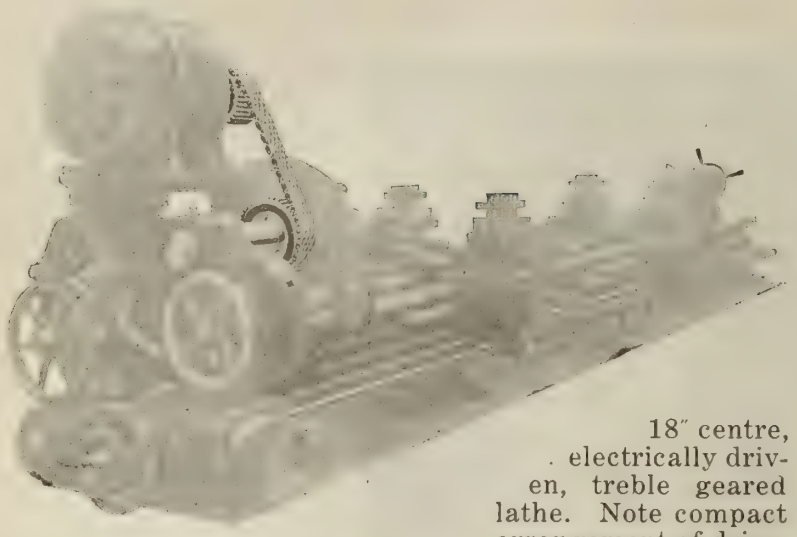
"THE COVENTRY" CHAINS



18″ centre, electrically driven, treble geared lathe. Note compact arrangement of drive.

THE REASONS FOR
CHAIN TRANSMISSION

Will work at a high speed and in either direction. Positive, yet flexible, turning movement. Will work on centres too long for gears and too short for belts, so that drive can be arranged to suit either details of design.
Unaffected by heat or cold — give positive velocity ratio, — minimize journal friction. Will transmit considerable power with high efficiency, which is retained. Increase output, give uniform quality of product, consume minimum of power. Minimum attention required for repairs or adjustment.

"The Coventry" Chain Company, Ltd., Coventry, England

Cables: CHAINS, COVENTRY. Codes: A.B.C., 3rd and 4th Editions

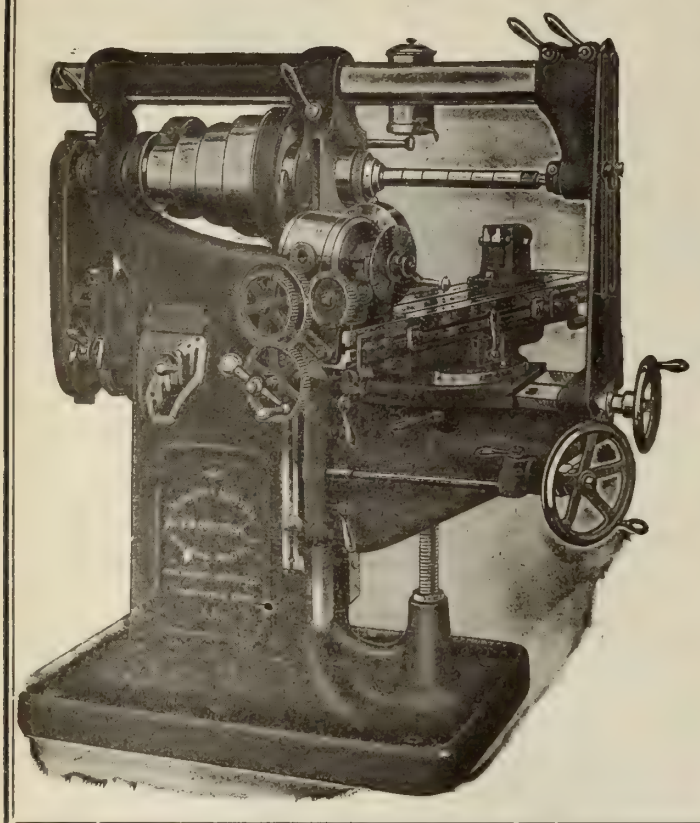
Anybody Can Operate This Miller



and Turn Out a Pile of Work so Simple to Operate is the

"HENDEY"

Skilled mechanics are scarce these days—but anyone can run a machine of its simplicity and turn out work accurately and fast without trouble.

All Feeds positive driven through gearings giving 18 changes.

This is the universal type—designed to handle all milling operations performed on machines of this character, either with regular equipment or by aid of attachments, which can be supplied for increasing efficiency and scope of machine.

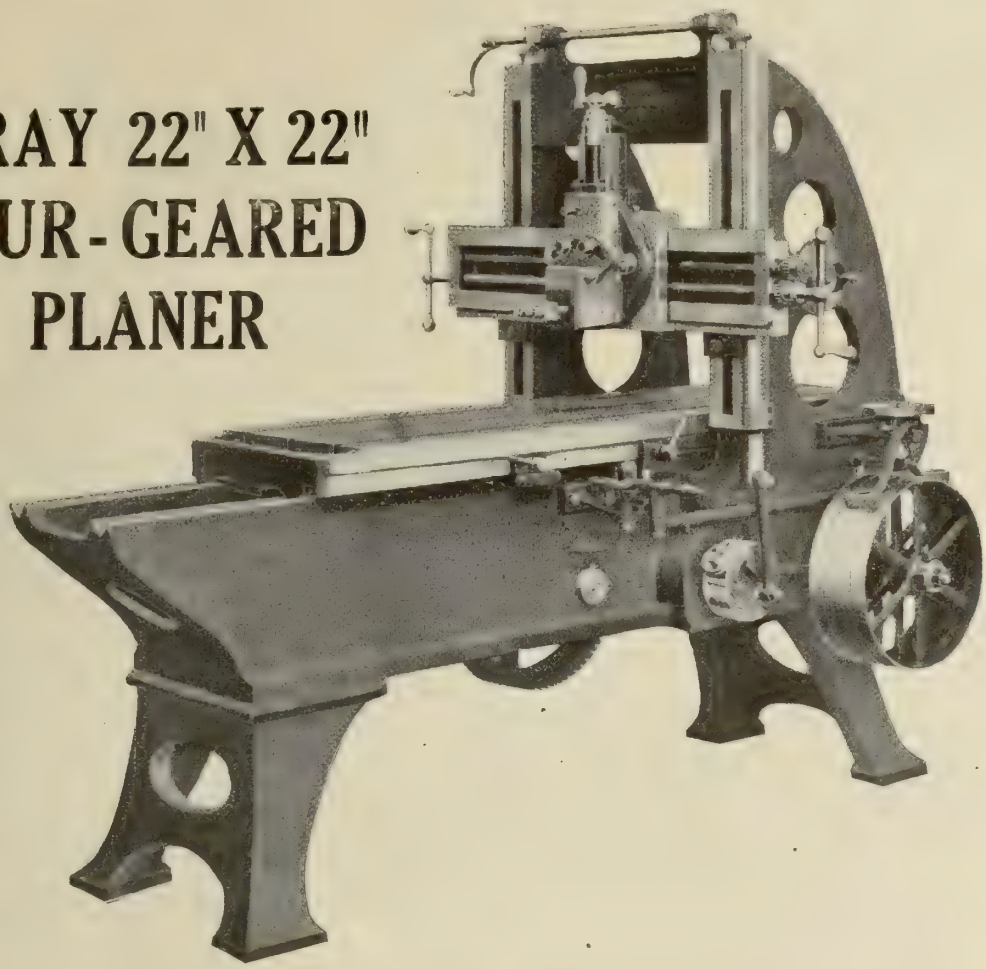
GRAY 22" X 22" SPUR-GEARED PLANER



Gray Planers are built by a firm that makes nothing but planers. They are given the entire time and attention of a large organization—and their performance shows it.

In designing this tool the parts have been so proportioned and the metal so distributed that the planer is quick acting and simple in operation, and yet sufficiently stiff, strong and powerful to perform a great portion of the work for which larger, heavier and more clumsy planers are ordinarily used.

May we send you full details?

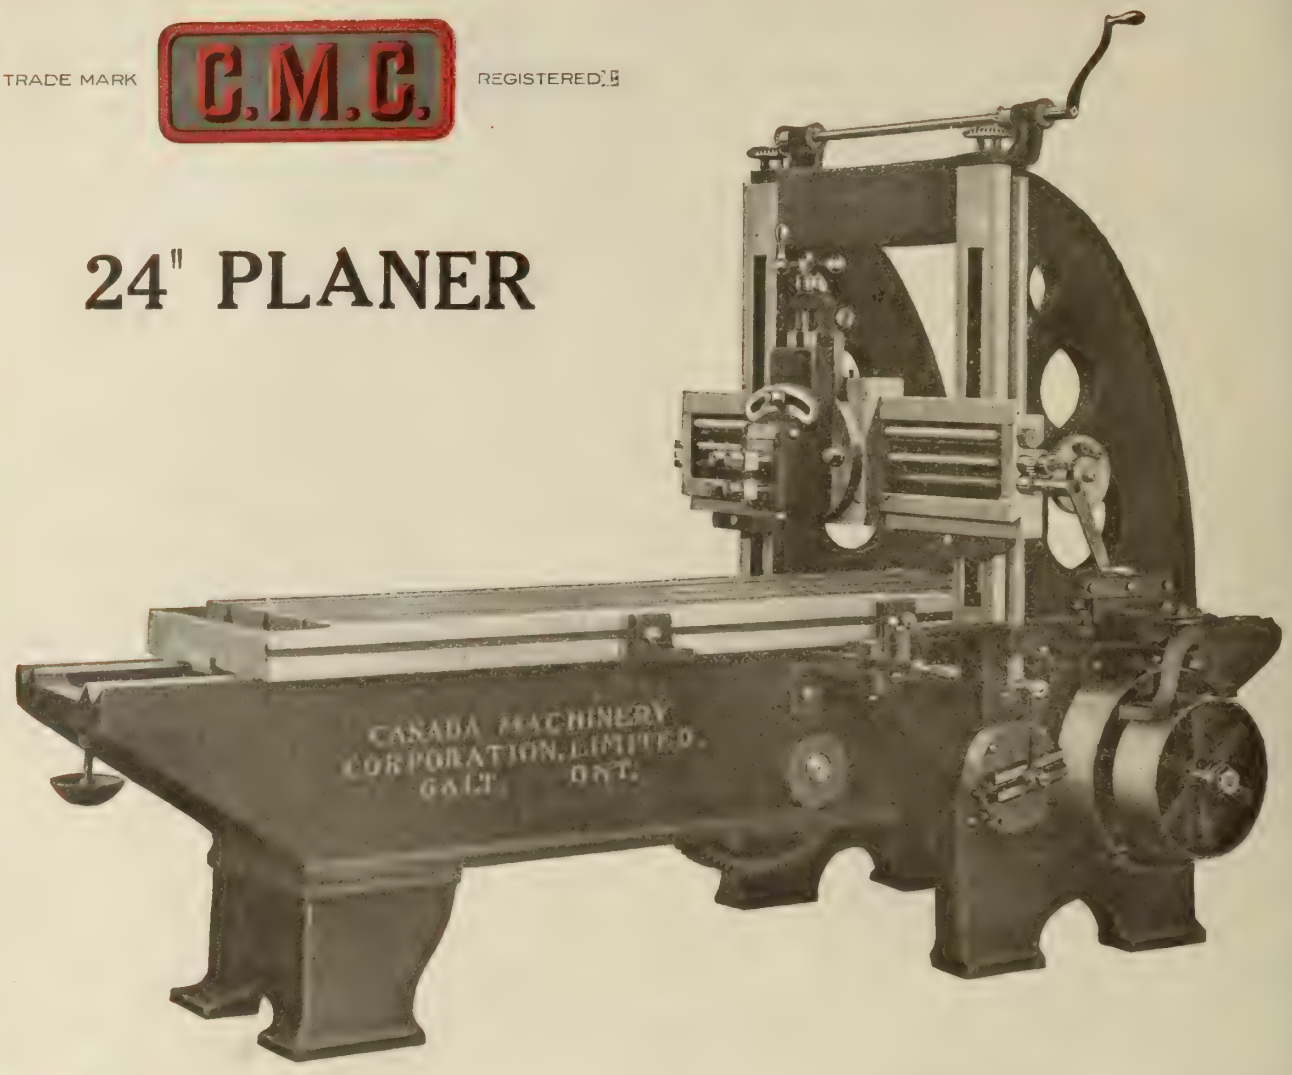
QUALITY Foss SERVICE

TRADE MARK C.M.C. REGISTERED

24" PLANER



OUR PLANER is built to combine solidity with convenience and speed of operation. An unstinted, yet judicious use of metal gives the machine an absolute rigidity under the heaviest cuts, while the operating mechanism and adjustments are as simple, effective and convenient as possible.

DRIVES. The machine is regularly built with single speed countershaft and standard drive, but can also be supplied with parallel drive or with two speed countershaft or four speed cone variator. Machine may also be arranged for motor drives as follows: With motor directly connected to first gear shaft; with motor mounted on housings and known as plain motor drive; with motor mounted on top of housings and connected to two or three change gear box, or through cone variator.

We manufacture Planers ranging in size from 24" to 48"

SMALL TOOLS

P. & W. Combination Lathe Knurling Tools

Combines Three Distinct Knurling Tools in One

You will save time by using this three-in-one Lathe Knurling Tool.

PROMPT SERVICE

is assured at our present store where P.W. Small Tools are carried in stock. Place your order there to-day.

It carries three pitches of knurls fine, medium and coarse, as shown in sample. This does away with necessity of having three holders or of changing knurls where but one holder is available. Same knurls can be used in this holder as are used in our regular Lathe Knurling Tool.

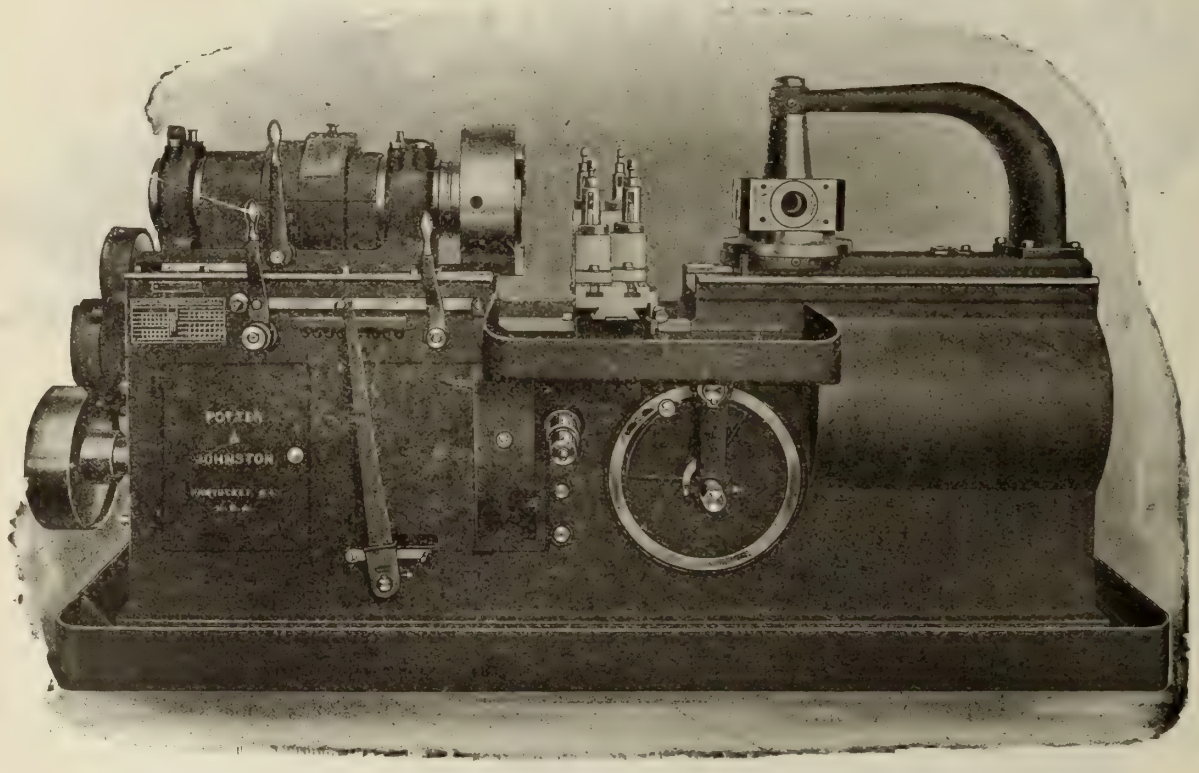
POTTER & JOHNSTON

"Do it Automatically"

You, too, Can Adopt this Method



6A — MANUFACTURING AUTOMATIC

When, back in the Middle Ages, a Frenchman mounted a piece of wood between two supports in such a way that it could be revolved against a cutting edge, the history of machine tools began.

With from two to a dozen cutting tools in simultaneous operation, with the operator only required to place the piece in the chuck and remove the finished piece, the machine tool has reached its highest development from a labor-saving, time-saving standpoint in the Potter & Johnston Manufacturing Automatic.

More and more shops, big, progressive shops, are realizing this fact; that they cannot do their manufacturing work so economically in any other way as on the Potter & Johnston Manufacturing Automatics. Some shops have fifty of these machines in use, some seventy-five or a hundred, and even three hundred. In one shop—think of it. Why don't you adopt that "Do It Automatically" method. **Ask for Bulletin 39.**

Purchase the Products of Canadian Mills

TO uphold the Glory we have jointly earned—to honor our noble dead—to comfort the wounded, and extend to the men returned the hand of prosperous welcome, we must cast aside all forebodings and face the future with unbounded courage and confidence and, without a shadow of doubt, declare to the World that this Nation, which was so quickly and successfully transformed to a War basis, can be depended upon to revert to Peace conditions with equal success. The buyer and seller must recognize their duty to the Nation and co-operate fully to the end that all products that can be produced in Canada by Canadian workmen shall not be purchased elsewhere.

OUR Duty is plain; Canada with Canadian labor and capital can produce, manufacture and distribute products sufficient to keep the wheels of industry turning to the limit. The song of Prosperity and Happiness should ring out all over the land. Let us sincerely pledge to the extent of our needs, to purchase materials produced in Canada by Canadian Workmen, and the result of our efforts will return to us the Blessings of a Prosperous and Happy Nation.

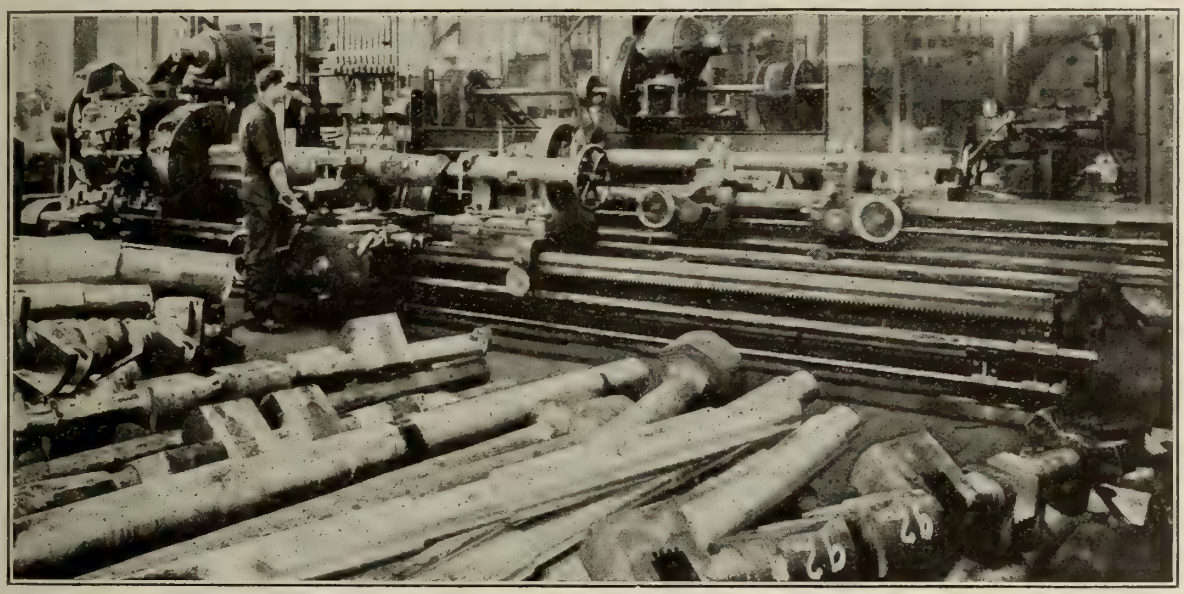
BRIDGEFORD

Heavy Duty Lathes



The above photograph shows a Bridgeford 27″ Manufacturing Lathe finish boring a cast-iron transmission housing for the new Fordson Tractor.

The diameter of housing is 19⅛″ and the limits of accuracy are .002″.

Maximum production is a requirement in the Ford plant and that is why a Bridgeford was selected to do the work. The Bridgeford turns out 30 pieces per day of 8 hours, which is excellent production.

There's a Bridgeford for every heavy duty lathe requirement. Bridgefords are in operation in all parts of the world on all kinds of duty. The line includes Heavy Geared Head Engine Lathes from 24″ to 72″ swing, Cone Driven Engine Lathes, Axle and Journal Truing Lathes and Manufacturing Lathes of 27″ and 30″ Swing.

Send for interesting data on Bridgeford Lathes.
We are in a position to make prompt deliveries.

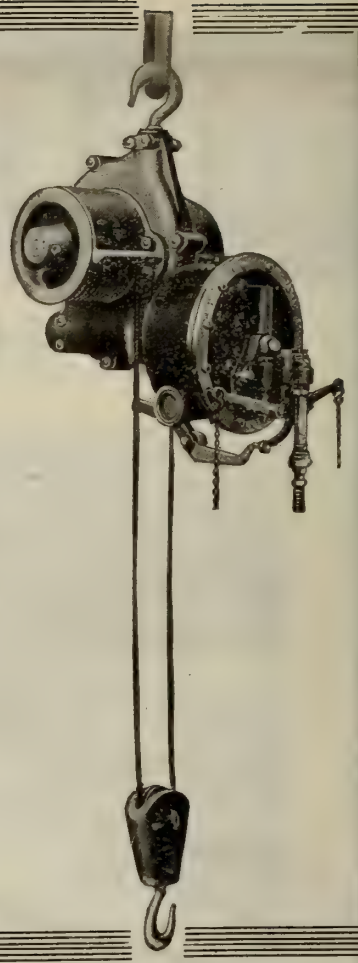
BRIDGEFORD

Less Overhead Expense



Whenever a strong, dependable hoist is needed, the "Imperial" air motor hoist fills the bill.

Few Parts Mean Less Trouble
The "Imperial" has few parts

The motor is completely balanced; the sensitive control allows the load to be raised or lowered a fraction of an inch at a time. Ball and roller bearings and thorough lubrication insure long wear.

The Keystone Upon Which All WILT Products Are Built

A high standard of perfection is maintained throughout the various processes of manufacturing WILT High Speed and Carbon Twist Drillls, Reamers and Milling Cutters. WILT products improve production! This is no theory, no untested statement, but an established fact backed by many of the largest manufacturers throughout Canada. For steady, reliable output of work that is satisfactory from the standpoint both of quantity and quality there is no better choice than WILT Products.

The Know-How of Making a Drill

Twenty-five years of study and practice have given the Hoefer Manufacturing Company the know-how of making a driller.

And know-how is a lot different from know-it-all. The Hoefer engineers are eternally plugging away to make a better driller.

This is the spirit you'll like in Hoefer service. If you will set your drilling needs before us, we'll give you the benefit of twenty-five years' contact with some of the drilling problems of the biggest manufacturers in the country.

Our product, Hoefer Drillers, embodies the latest word in design, efficiency and accuracy.

Regardless of the size of the press, drilling is possible to a fine degree of precision, provided you use Hoefer Drillers, the recognized standard for a quarter of a century.

Catalog showing complete line on request.

HOEFER MFG. CO.

FREEPORT, ILL.

Individuality

A GREAT MAN wrote this: "I'm called away by particular business, but I leave my character behind me." And nobody had to guess whose character it was. Even if the familiar Red Cut label should disappear there would be no doubt as to the character of the steel that remained. More than ever would the quality shine forth in the results when it was worked. Adherence to the highest standard with an unvarying uniformity has placed a well merited reputation all its own on

GALT - ONT.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25%; a different method of molding them might double your production at no increase in molding cost. **We can advise you** and we have expert metal and wood pattern-makers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.
We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us.

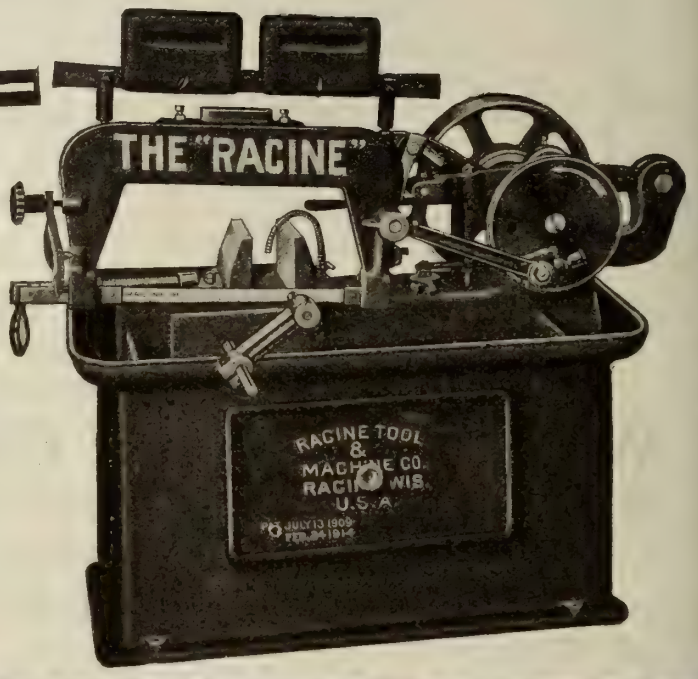
ASK US

"THE RACINE"

High Speed Metal Cutting Machine

Standard the World Over

This is the only machine in the World that has an ABSOLUTELY POSITIVE AUTOMATIC LIFTING DEVICE, a feature secured by patents. Another feature is the rigid saw frame guide. These two assets combine to give long life to the cutting blades and save a lot of money.



"THE RACINE" minimizes wastage, cuts accurately and with great speed. Then they are easy and cheap to operate. These features are appreciated by the best shops everywhere and that's why "THE RACINE" sets the "Standard the World Over." Write for full particulars.

Use "RACINE" H.S. Tungsten-Power Blades.

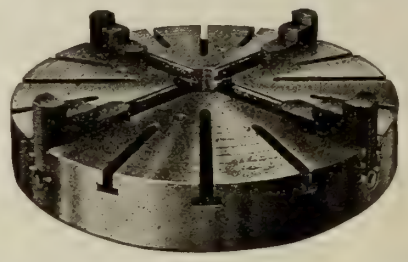
GOOD MECHANICS
Show preference for the
UNION INDEPENDENT CHUCK



It has an iron body, and is made heavy and strong. The double bearing ribs for the jaws make a stiffer chuck for heavy work than the ordinary single rib type.

The screws are also of the "socket" type and operate in hardened steel thrusts, which also add to the strength and stiffness of a chuck that is designed for **heavy duty.**

The jaws are wide and the screws are correspondingly large.

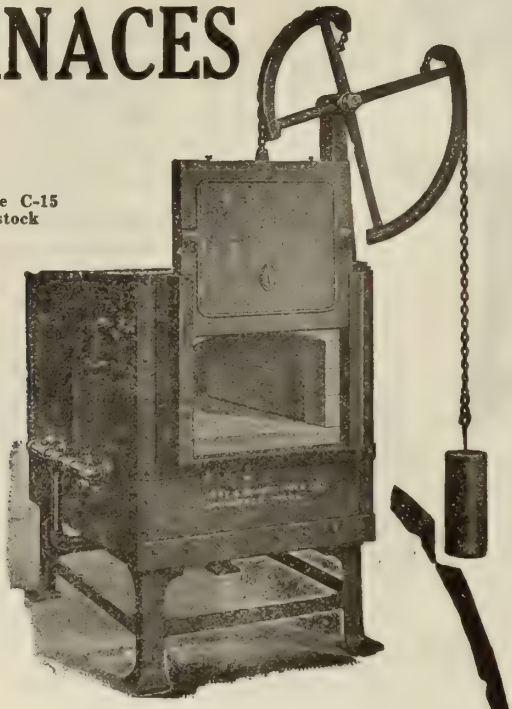
GILBERT & BARKER FURNACES

Type C-15
in stock



Shipped on Receipt of Order

If additional proof was required of the efficiency of Gilbert & Barker's heat treating furnaces, this proof was generously supplied during the World War. Industrial plants throughout the United States and Canada engaged on war contracts covering the manufacture of munitions, ordnance, airplanes, motor trucks, tanks, etc., found it necessary to secure on short notice a thoroughly efficient furnace. As designers and builders of heat treating furnaces for a period of more than 50 years it was quite natural that the demand for G & B equipment should be heavy.

You don't have to pay for experience nor do you have to take chances on inefficient heat treating furnaces. G & B furnaces can be depended upon for accuracy and efficiency, plus low operating cost.

There is a G. & B. furnace for every heat treating requirement. Tell us your problem and we will promptly tell you the type of furnace best suited to your needs, but first send for Bulletin 24. Today is a better day than tomorrow—write.

Notes On Grinding
NORTON COMPANY, WORCESTER, MASS.

No. 63A

Automatic
vs.
Hand Feeding

A great many operators are indifferent about the method of feeding the wheel into the work, and this attitude brings varying results in the finish ground product. There is entirely too much tendency on the part of those operating grinding machines to use a hand feed in bringing the wheel in. This results in irregular feeding and calls for undue service from the wheel.

In previous articles it has been pointed out that the relation of wheel speed to work speed and the amount of feed are responsible entirely for the degree of efficiency with which that wheel operates. If this hand feeding, which varies from time to time, is persisted in, naturally the wheel, under certain conditions will not act efficiently. Those conditions arise when the wheel is fed too deeply into the work for the grain and grade and speeds used.

All good grinding machines are provided with automatic feeds and these automatic feeds are so arranged as to regulate the amount of feed that the wheel advances with each revolution of the work, or each stroke of the table, there being different kinds of feeds which carry either at each end of the stroke of the table or at each revolution of the work. These predetermined and regular advancements of the wheel allow such a wheel to act under its normal and effective conditions, resulting in a greater output, longer life of wheel and increased quality of product.

Many times chatter marks can be traced to hand feeding. The operator may be pressed for large production and brings his wheel in rapidly, in order that he may perform with his hands other operations, such as dogging the work. This allows the wheel to fill with steel and cut irregularly on the face. When the cut is allowed to die out, chatter marks, mottles, or blemishes in the work are produced.

Production is also affected by these conditions. It is universally true that where the automatic feed is adhered to religiously, production is at its highest point and quality is always the best.

Alundum wheels of the vitrified process are recommended for the internal grinding of hard and soft steel.

Volume XXII. No. 4 Toronto, July 24, 1919

Building 5-inch Gun Mounts at Brantford

Close Limits Were Absolutely Essential on This Work—First-Class Tool Equipment, Together With Special Machines and Fixtures, Made Such a Condition Possible—This Article Will Appear in Two Parts

By J. H. MOORE, Associate Editor Canadian Machinery

HOW many readers of CANADIAN MACHINERY know that for the past 2 or 3 years, right up in Brantford, Ontario, a large, up to the minute machine tool plant has been turning out 5-in. Naval Gun Mounts for Uncle Sam's Navy? Not many, I'll warrant, and yet such is the case.

To confine the main information to its briefest form, let us just state at the commencement of this article that the firm spoken of is the Dominion Steel Products Company, of Brantford, and the work and its procedure of manufacture, refects great credit to the above firm for the way the product is being handled.

The machine tool equipment in this plant is a positive treat, and if the writer does not enter into each particular tool throughout the plant, it is not from lack of enthusiasm, but rather through lack of space in an article of this nature. He will, however, try, in as far as possible, to give readers a good idea of the general main operations, and method of manufacturing this gun mount, so asking readers to remember that this article s subject to check from the U. S. authorities, therefore all definite dimensions or detailed drawings and sketches are omitted.

We will now go on to the article itself, and to form a good idea of what we propose following up let us look at Fig. 1, which shows a mount practically completed.

This view is shown with a two-fold purpose, first to bring to the reader's eye a general assembled view of the product about to be discussed, and second, to explain points on the photograph. We will not however touch on these points for the present, but ask the readers to simply study the photo for a general idea only, and to remember that the portion marked A is called the stand, the portion B the carriage, and the portion C the slide.

These three portions are the main castings on this product, so now since readers are no doubt familiar with its general appearance we will pass on to the portion A, the stand, and follow up its operations.

The first few operations are completed on Bertram vertical boring mills, the first of these operations being facing off the bottom. The next operation in sequence is illustrated at Fig. 2.

This operation consists of boring and turning to the various diameters, double heads being used as can be seen from the photograph. In the next operation a bronze ring is shrunk on the portion

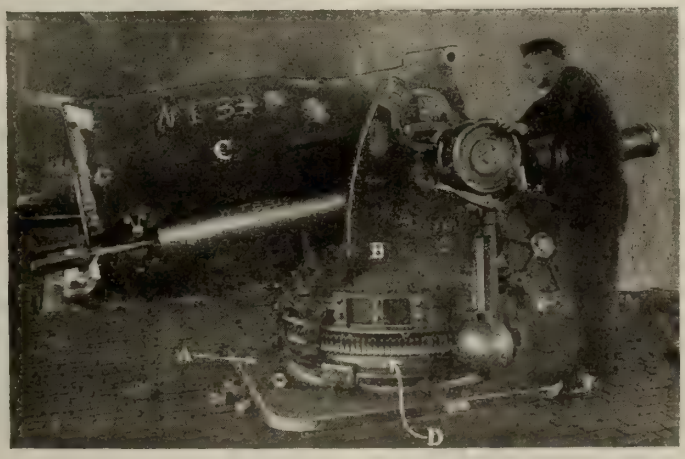

FIG. 1.—GENERAL VIEW OF THE MOUNT.

A, and turned to size right in place on the mill. The other remaining operations are the standard style of milling and drilling, so no further mention of these is made, except to say that before completion, the roller race seat is scraped in carefully to allow the same to run correctly.

The Training Circle

In Fig. 7, we show the operator at work cutting the training circle already spoken of. This is a very important and interesting operation, and some particulars as to the style of machine tool used, the time spent on the operation, etc., etc., will not be amiss. First the piece itself is made of cast steel. The machine used is a gear cutting machine, made by the Jones Superior Co., of Chicago, Ill. There are 135 teeth in this circle of 1 in. circular pitch. The work is cut with a Brown and Sharpe hob running at 76 in. per minute. Lard oil is used as a lubricant, and the time spent in cutting one of these circles is only 5 hrs., which is splendid time as readers will no doubt agree. The work comes to this machine direct from the lathe. The contour of the worm is machined out, but otherwise no previous gear cutting work has been done on this piece. Of course readers can understand that the circle turns slowly around as the hob revolves, the teeth being cut deeper each revolution.

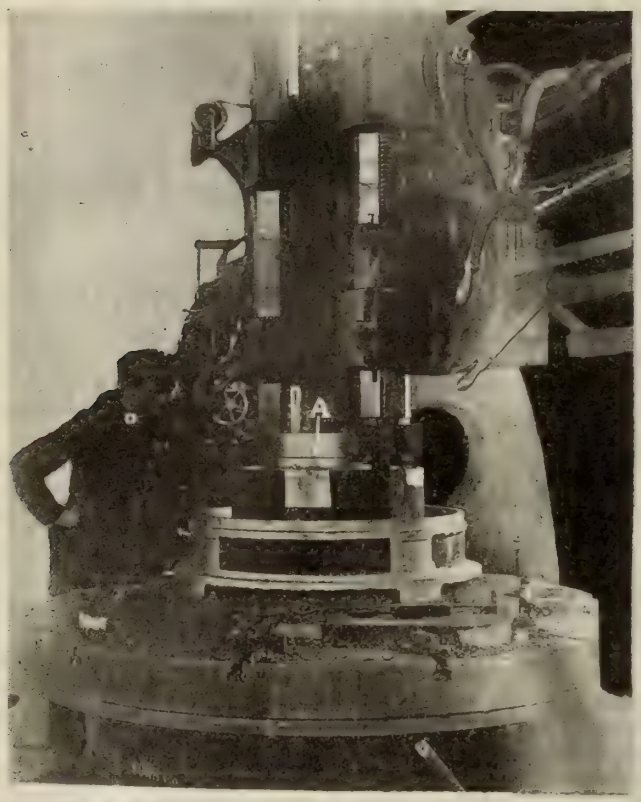
The Carriage

We will now pass on to the carriage, and its various stages of manufacture. The very first stage is the laying out process. In fact this laying out operation is the first stage of operation on all the larger castings, including the stand we have already described. First the casting is painted with a whitening compound as shown at Fig. 3, when the various lines, centre punch marks, etc., are laid out. In this photo you will note the heavy angle plate, used in conjunction with large hand marker. The workman simply gets the angle plate in proper position on the layout table, places the marker against the face of the angle plate, and drawing it down the plate, describes with the point of the marker whatever line he desires. In the case shown on the photograph he is drawing in the line designating the centre of the carriage. To watch this fellow at work is a treat, for he has become so accustomed to his work, that what to the average workmen would be a painstaking and ardous task, is to him

a mere matter of routine work. Readers will note the huge surface gauge used on this work, and the proportion of the workman to the casting of the carriage, will give some idea of its relative size.

Immediately the carriage is laid out, it is picked up on an electric crane, and taken direct to the boring mills, which start the first actual machining operation. Two 7-ft. Bertram Vertical Boring Mills handle these carriages, and they are placed in a large special designed jig for the purpose.

They next go to the radial drill, and have some rough drilling operations performed on them, but as this is standard work, no special mention of these operations is made.



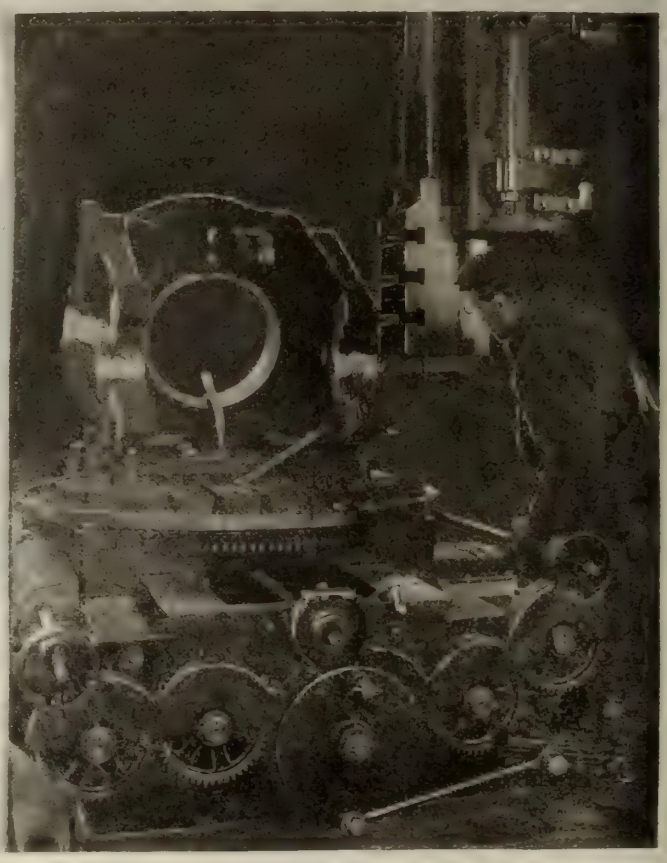


FIG. 2.—BORING AND TURNING THE STAND.
FIG. 4.—FACING THE TRUNNION BEARINGS.

FIG. 3.—LAYING OFF THE CARRIAGE.
FIG. 5.—SLOTTING OPERATION ON THE CARRIAGE.

They are now moved to a huge 24-in. C. M. C. slotter such as shown at Fig. 5, where various operations are performed

as follows. The sides of the trunnion bearings are machined as shown on the photo, and also the bearings are slotted out to suit the caps for same. The portion marked A on Fig. 3 is also machined on this slotter, the gearing mechanism shown on Fig. 5 allowing for the turning of the slotter table at the proper speed to make a complete circle at the proper relative speed to the ram and cutting tool of the slotter. The time taken on these operations varies with amount of stock to be removed so no mention of actual operation time is given.

The doors B (see Fig. 3 once more) are also milled, for these must be absolutely water tight when the door covers go on.

The carriage is now moved to a battery of five 6 ft. x 6 ft. Landis horizontal boring mills.

Various operations are performed on these machines, but as we cannot enter into too much detail without occupying an enormous amount of space, we take up only one operation on these machines, namely the boring of the trunnion bearings after the caps have been placed in position, also the facing of these caps and bearings.

The boring of the trunnion bearing holes is of course done with the usual boring tool and bar, while the facing is done by means of two heads shown in Fig. 4. The operation is self-explanatory for the average machinist knows how such a style of facing head works. A very notable feature about these machines is this: that each machine is kept in perfect condition, in fact the same may be said of every machine in this plant, for the tolerances allowed in the various operations are so small that it is an absolute necessity that all machines be kept in the pink of condition. Another feature in these mills is that each mill has been specially fitted with a vernier attachment, which guarantees the working to very close limits with perfect safety. This vernier scale is attached to the cross feed of the machine.

There are, of course, other operations in these carriages before its completion, but we have touched on the principal ones to give readers a fair idea of the work involved.

The Slide

This piece is of course laid out first, after which it goes to a huge planer, and various operations are performed, but as these are of the usual nature we pass on to the actual boring operations.

The slide is now moved to a specially adapted Le Blond Lathe, and the centre hole is rough bored. After this preliminary operation it is moved to the machine shown at Fig. 6. This was built by the Conradson Machine Co., of Green Bay, Wis., and detailed attention to its construction is well worth while. The machine consists of three independent drives, namely the main spindle, and the two side spindles, one of which is clearly shown at A. It will be noticed that two independent motors drive these side spindles. Briefly the action of operation is as follows: The main spindle finish bores the centre hole, which receives the gun barrel, while the two side spindles with the aid of special turning heads B, turn the two trunnions, as can be clearly seen from the photo. It can be noticed that the complete slide is enclosed in a special jig for the purpose, in fact it is the splendid system of jigging as adopted by this concern that makes the turning out of this product such a success.

Two bronze bushes are now pressed into this finished bore, a long, and a short one, the former being towards the outside portion of the slide when assembled. These bushes are of course machined in other operations, but again we do not touch on these points simply because the work is of the usual style, and therefore of no special interest to the reader. After these bushings are in place, they are finished bored right in position in the slide. To do this they are placed in a special jig, and bored in a lathe as shown at Fig. 9.

It will be noticed that this jig is so constructed that the work is supported directly from the trunnion bearings which have already been turned. In fact to be exact, various other operations have ensued before this operation takes place, but we show it now for convenience, besides, we wish to refer to this view a little later as readers will discover later on in the article. But to continue on the finish boring of these bushes. The style of boring head as employed can be plainly noted, so no further comment on this point is necessary.

We would like however to call readers' attention to the parts marked A and B on this photo. At these points can be fastened a connecting rod, which pulls the saddle up and down at the proper speed to groove the bush for oiling purposes.

This idea cannot be as clearly illustrated as could be desired, but readers by following the description can see how the scheme works out. In the direct centre line, (not seen on photo) but about the position A is a crank, with T slot cut across its face. The action is now perhaps self-explanatory to many readers who have run shapers at some time or other, for the action of the stroke is similar. By connecting the rod between the permanent bolt B, and the sliding bolt on this disc A, the stroke can be altered to suit requirements. The worm shown at C is connected to a worm wheel, and the rate is such as to give the desired spiral twist to the grooving. This idea is adopted at various points throughout the plant, not always by means of worm and worm wheel, but in some cases by compounding trains of spur gears.

Special Profiling Machine

We will now refer the reader back to Fig. 9 for a definite purpose, namely to call his attention to the portion of slide marked D. This operation is known as the knife edge bearing support, and is a very important operation, as the bearing which goes into this seat takes the complete weight of the gun. For the present let us content ourselves by studying its general shape and appearance.

To machine this portion a special portable profiler was made as shown at Fig. 8. This machine in itself is worthy of special atention. First, the slide itself rests on a special jig plate. The portable combination table and head is now placed directly over the trunnion bearing. This table has a hole in it the correct size to accomplish this object. Of course, the idea is now clear as the machine is now ready for work. First the portion to be machined is milled to width, then to length. It is now faced to height, and a radius milled on the sides. The portion of slot cut into the trunnion is now machined. Of course, as can be seen, an independent self-contained motor drives the machine. This idea goes to show just what can be done by the making

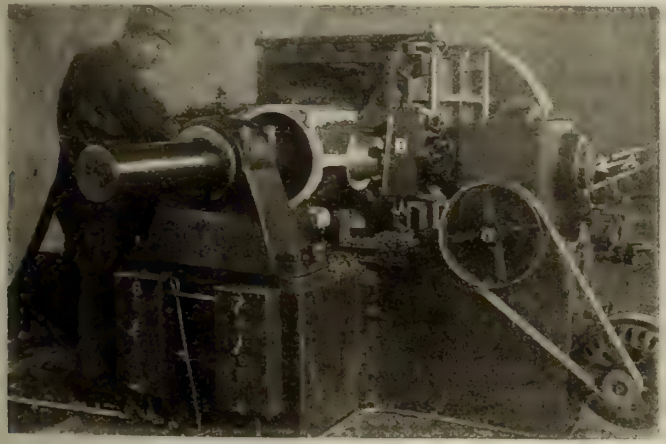

FIG. 6.—BORING CENTRE HOLE AND TURNING TRUNNIONS.

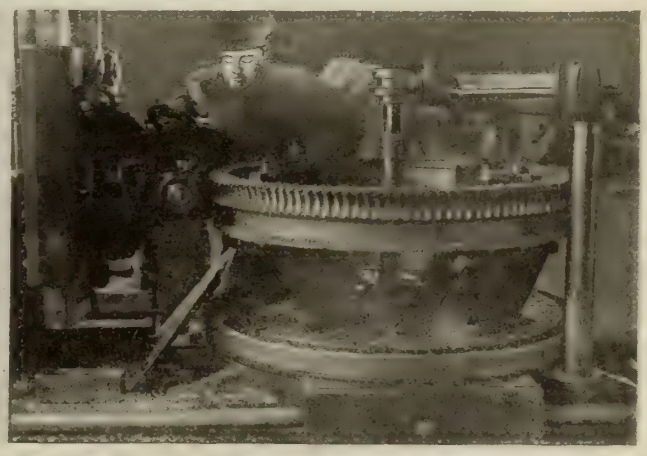

FIG. 7.—CUTTING THE TRAINING CIRCLE.

FIG. 9—BORING THE BRONZE BUSH.

FIG. 8—PROFILING THE KNIFE EDGE BEARING.

of special machinery for a special purpose.

Slide Operations

We cannot attempt to speak of all slide operations, but we shall show one more, namely the boring of the recoil cylinder. In this operation the clearance of the recoil spring cylinders is machined. The method of machining is the usual boring bar and tool equipment, the reason for the photograph, being to show the construction of the jig. On this page are three bushings on each and to guide the boring bar, the centre one now in operation being the recoil cylinder hole, the other two (one on each side) being the guide holes for bar, when the clearance for the recoil spring cylinder is being machined. Throughout the description of these operations we have not strictly adhered to the regular sequence of operations, but we have tried to speak of them in the easiest manner to be followed by the reader, as after all this style will no doubt appeal more to the general reader. Owing to the extreme length of this article we have divided it into two parts, and at this point we will drop the article for the present, but will start next issue from the point where we left off, and will continue until the completion of these mounts ready for shipment, together with other various operations involved.

Telford and Macadam, both English engineers, introduced certain principles of road-building in 1800 which are, to a great extent, the basis of modern construction.

COPRA INDUSTRY

By L. P.

IT IS the irony of fate that, while the Occident is on short commons of oils and all fat products, the Orient has a plentiful supply, of which it cannot dispose advantageously. In British Malaya, for example, the lack of shipping has militated against the copra industry.

Mr. L. Lewton-Brain, Director of Agriculture, Federated Malay States, in his annual report states that shipping difficulties caused the local price of copra to remain very low throughout 1917, and both estates and small holdings have suffered considerably. One result has been that a large number of cocoanut trees, particularly in the State of Perak, were cut out, and an enactment had to be passed to prevent a recurrence of this, except in special conditions. The price of nuts remained fairly high in the inland markets, but very low in the coast districts.

Another result has been that a discussion has arisen on the possibility of the extension of the local oil-expressing industry. So far no definite scheme has been put forward, though, as all cocoanut estates are keenly interested, it is to be expected that some scheme will be evolved before the expiry of the current year.

Upon reference to the summary of the foreign imports and exports of the Straits Settlements and British Malaya for 1917, we find that the total export of copra last year from the Malay Peninsula is given at 77,900 tons, against 73,236 tons in the previous year; but whereas the value of the 1916 export is returned as £1,407,309, the value of the larger export in 1917 is given as £1,190,-314. The export of cocoanut oil in 1917 is given as £1,190,314. The export of cocoanut oil amounted to 5,891 tons in 1916, valued at £285,373.

In view of the possibility of the African oil palm coming into prominence as a plantation crop in Malaya an experiment consisting of fifteen tests has been planned by the F. M. S. Agricultural Department, in order to determine the best method of promoting more rapid germination of the seed. The palms near the agricultural offices at Kuala Lumpur showed good growth for the year. Many enquiries were received regarding the cultivation of this crop, and the required information was given by the Department.

Frequently when visitors are invited to a factory restaurant for lunch there is some embarrassment caused when the check is issued.

This is avoided at the Ferro Machine Company by issuing complimentary lunch tickets to visitors. These are taken up by the cashier and charged to the company.

Not only does this system do away with embarrassment but is in accordance with the hospitality usually extended to such visitors.

The New Moffat Electric Steel Furnace

Features of Design Which Make For Economy in Operation and Refractory Endurance Are Incorporated—The Arrangement of Electrodes is Also of Interest

By W. F. SUTHERLAND

RECENT developments in the smelting of iron ores by a duplex process employing the electric furnace as the final step for the melting of sponge were described in the April 3 issue of CANADIAN MACHINERY by J. W. Moffat. While the electric furnace which will be used in this duplex process may be of any type, it is of interest to note that Mr. Moffat has developed a design for the refining of steel which is capable of very economical operation.

In some respects this electric furnace resembles the three-phase types now in common use, the three electrodes projecting into the bath from above. Usually in such furnaces, however, the refractory lining of the walls and the shell are circular in shape, and the electrodes are arranged one at each angle of an equilateral triangle equidistant from the walls.

In the operation of such furnaces trouble is frequently encountered by reason of the crescent-shaped masses of partially fused raw material found clinging to the walls between the electrodes, this material being thickest at the point midway between any two electrodes. These masses are often difficult to get into the bath, as in their partially fused state they adhere to the colder wall of the furnace. In endeavoring to remove them by mechanical means, injury is often done to the lining of the furnace, portions being carried away and into the bath.

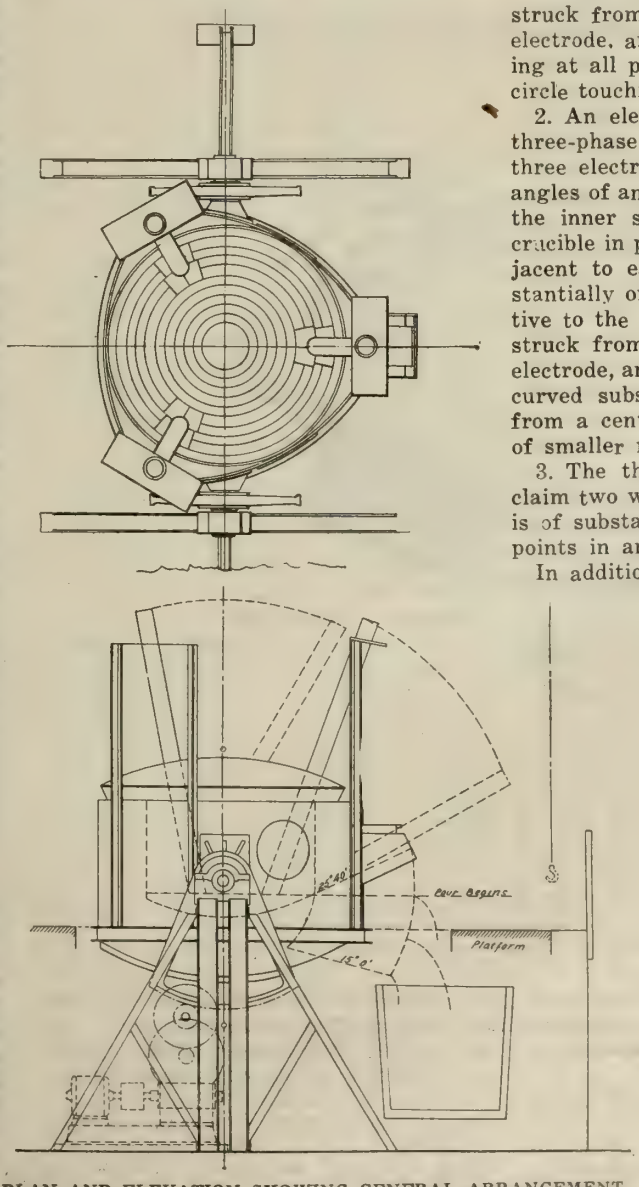
The more usual practice is to increase the input of electrical energy and to melt off the partially fused material. This procedure, however, increases the length of time for the manufacuring of the steel, often as much as one-half hour in a heat which should be taken off in about four hours, and means an increased cost amounting to 12 to 15%. The practice is also objectionable, as it leads to overheating the already fused material in the bath, and also to the overheating of the furnace walls nearest the electrodes.

New Design

In the design developed by Mr. Moffat, for which patents have been recently issued, these difficulties in operation have been overcome by shaping the body to conform to the lines of current flow in the bath of molten metal. The characteristics of current flow in a flat plate or an approximation thereto are well known, and the current is distributed throughout the metal, the lines of equal current density being in the form of current arcs from pole to pole.

The shape of the walls is well illustrated in the accompanying diagrams, and it will be seen that the walls are brought inward between electrodes in such a fashion that no cold spot occurs, and the growth of partially fused nodules of metal avoided. In other words, the furnace walls are so shaped as to conform to the isothermal lines of temperature in the furnace.

It is also found that to secure the best results in wall life, that the wall itself should be of equal thickness at all points in any horizontal plane, and by so arranging it, the radiation is the same at all points, thus rendering it impossible for any one point of the inner lining to become heated to a higher temperature than other parts of the same wall. In this way the overheating of portions of the wall is avoided, and one of the most fruitful causes of short refractory life avoided.



PLAN AND ELEVATION SHOWING GENERAL ARRANGEMENT.

The claims made for this furnace in the patent specifications, are of interest, and are given below.

1. An electric furnace, operating with three-phase current, and provided with three electrodes arranged in plan at the angles of an equilateral triangle, in which the inner surface of the wall of the crucible in plan is shaped as follows: Adjacent to each electrode curved substantially on an arc of small radius relative to the spacing of the electrodes and struck from a centre in the axis of the electrode, and between the electrodes lying at all points within a circumscribing circle touching each of the arcs.

2. An electric furnace, operating with three-phase current and provided with three electrodes arranged in plan at the angles of an equilateral triangle, in which the inner surface of the wall of the crucible in plan is shaped as follows: Adjacent to each electrode curved substantially on an arc of small radius relative to the spacing of the electrodes and struck from a centre in the axis of the electrode, and between any two electrodes curved substantially on an arc struck from a centre adjacent the opposite arc of smaller radius.

3. The third claim is a repetition of claim two with the addition that the wall is of substantially equal thickness at all points in any horizontal plane.

In addition to the above operating advantages, the shape lends itself to the securing of a number of other important advantages. The lining is built up entirely of key and wedge bricks. This results in their being held rigidly in place relative to one another, and they are, in consequence, unable to work inwards to the open space of the bath. The bottom is an inverted arch formed with an outer lining of arch brick, silica or fire-brick, and an inner lining of magnesia key brick on top of which may be placed another course like that last, or a burnt-in bottom of grain magnesite may be used of equal thickness.

If the operator in taking a heat is careless and not watching his slag, there is no fear of a run-out caused by a brick floating up, as they are all keyed.

The Roof

When the furnace requires a new roof it can readily be placed in position with the aid of a crane in about one-half hour, owing to the convenient arrangement of the electrode guides.

On each electrode two upright guides are spaced equidistant from the electrode opening in the roof. At the top of these uprights the guides pass downward at an angle of 70°, and are fastened to the roof cooling casting inserted in a gain made in the roof brick around the electrode opening. These guides are hinged at the top of the uprights.

When a new roof is to be placed in position two bolts are loosened, and after the electrode has been raised to clear the roof all that is required is to lift the roof cooling casting about two inches, enough to clear the gain in the roof, and the whole assembly can be swung out of the way of the old roof being taken off and the new one being placed in position.

CROSS-SECTION SHOWING SHAPE AND METHOD OF LAYING UP LINING.

SCIENTIFIC RESEARCH

The Special Committee on Scientific Research deserves and requires generous encouragement and financial support from the Government. Under the sanction of the Research Council Act of 1917, and by means of the Honorary Advisory Council for scientific and industrial research a survey of the field has been made. Time has come when further steps must be taken and additional financial support be available if Canada is to keep pace and make a proper use of its assets.

We have no institution corresponding to the Bureau of Standards at Washington, so are dependent on U. S. and other countries for information and guidance in matters which vitally concern her industries. The committee recommends the establishment of a Dominion Bureau of Standards. Concerted and continued efforts should be made to place before the people the facts concerning scientific research and the advantages of national support thereof. The committee does not feel they have had sufficient time to digest evidence and so forth to make definite suggestions, and asks to be reappointed as early as possible next session to give the matter further consideration. They ask that their proceedings be printed for distribution and be put in the sessional journals.

There are, for instance, 1,500 square miles of tar sands in Northern Alberta near Port McMurray in a stratum from four to ten feet thick, and the tar in the deposit ranges in concentration from ten to eighty per cent. The tar sand was used to pave a street in Edmonton, which pavement has been in satisfactory use for five or six years. The quantity of sand mixed with the tar is a handicap, as, if transported long distances, the sand would be a serious factor in the freight charges. A grant was made to determine a cheap method of separating the tar from the sand on a large scale, but, owing to the impossibility of finding scientific and specially qualified engineering experts, nothing has yet been done.

SAFEGUARDING BAR STORAGE

In storing steel bars it is quite common to stand them on end in special racks. For that matter this is one of the most economical and space-saving methods of storing. These round bars, however, unless the workers are quite careful, are apt to fall over.

To prevent this, one firm has placed a bar across the front of each rack. This can be lifted up out of the way when it is necessary to take out steel bars and then placed back in position before the worker leaves the storage rack. Perhaps some such method as this would make the bar storage safer in your plant.

British Mission to Canada.—The National Union of Manufacturers of Great Britain is proposing to send six of its most prominent members to Canada to study conditions, and obtain information relative to the furtherance of British export trade to Canada.

The Scope of the Works Laboratory

The Relations Which Should Exist Between a Works Laboratory Are Herein Ably Discussed—This Paper Formed an Interesting Subject Before the Birmingham Section of the Institution of Mechanical Engineers

By MR. BARCLAY

THE relations which should exist between a works laboratory were very ably dealt with in the paper which Mr. Barclay read before the Birmingham section some time ago. Mr. Barclay has certainly earned the gratitude of all existing and potential works chemists for the very eloquent way in which he described some of the directions in which a works laboratory could be of real practical use to industries. This paper is the result of a suggestion thrown out during the reply to a somewhat lengthy discussion, and is not therefore to be regarded as a separate dissertation, but rather as a further contribution to that discussion. It is not overstepping the mark to say that the future industrial prosperity and commercial supremacy of our whole Empire depends to a vary large extent upon the application of science to industry, but nevertheless it is a somewhat appalling thought that only the shock of the most disastrous war which has ever stemmed the tide of civilization could bring home to industry the desirability of a closer union with science. Even now it is doubtful if the advantages to be gained from a proper application of science to industry are recognized to anything like the extent they should be. The view "of course it is the patriotic thing nowa-days to employ Doctors of Science and those sort of people, but when the war is over we shall be able to do without them" has been expressed. This is no doubt an extreme case, and it is exceedingly gratifying to report such a feeling does not exist in the metallurgical and engineering industries. In these industries, at least, there can be no doubt that the laboratory has come to stay. And why? Because it has proved its value. The fact that the laboratory has come to stay because it has proved its value is a most important one, which should be taken to heart not only by the captains of industry, but also by the laboratory workers. Since, therefore, there is in one section of industry an undisputed demand for trained scientific workers, it is highly desirable that the demand should be catered for as widely as possible. In this connection it is quite futile to quote as examples Germany and America, for granting the fact that a closer application of scientific principles has contributed to their rapid rise in the industrial and commercial worlds, their cases are not parallel with ours. The great Anglo-Saxon stock from which we have sprung has always been a pioneering race with originality for its most powerful characteristic, and to graft on to that character the Teutonic attributes of copying and exploiting would be a great national disaster. Rather let us seek out some method of our own, and in its development use our natural judgment in determining the modifications which seem to be advisable in view of what has occurred in other countries. They have undoubtedly made mistakes by which we should profit, for herein lies the key of progress. Perfection is an ideal which can only be striven after; it is not within human capacity to attain it, and after all, the perfect world would probably be a poor sort of a place to live in.

The statement of the problem is very simple—on the one hand we have that most fascinating study, science, and on the other hand industry, on which our greatness as a nation depends, for after all it is the industry of a nation and not its "will to conquer" which determines its ultimate greatness; the problem is to determine how the two can be harnessed together so as to be of the maximum use to each other. We hear so much of the benefits which will accrue to industry by the application of science to it, that we are apt to overlook the fact that industry has been of incalculable help in scientific development by supplying it with many complex and fascinating problems, and the recognition of this fact by the scientific worker is of equal importance, with the recognition by the manufacturer of the benefits which his particular industry will derive through the assistance of science. Obviously the first thing to do is to provide a laboratory; not a very difficult matter in these days, when manufacturers are even prepared to co-operate in their upkeep. At the very outset it is essential to confine our attention to some particular type of laboratory, for since there are over 20 different branches of industrial chemical activity, it might be assumed that there must be essential differences between the functions of the laboratory in a fine chemical works and that in an engineering works; but a closer inquiry indicates that the differences are only in matters of detail. Differences in detail will always occur; for if they arise in no other way the human element will create them. In such an inquiry as this we can only consider general principles and leave details to look after themselves; far too many promising schemes are nipped in the bud by a too early attention to detail. To avoid confusion, however, our attention will be confined entirely to the type which should be formed in works engaged in the production or use of metals, for both these works will require laboratories of similar type and equipment. It is not within the scope of this paper to discuss design and equipment: these will depend largely on the staff, for each man will have his own particular method of attacking a problem put to him. The equipment, however, should include a technical library, and the staff should have access to current technical literature in all languages which they are capable of reading. Mr. Barclay has already outlined the work which a laboratory should undertake—in brief, his paper means that the works laboratory should be held responsible for the quality of the raw material and materials incidental to manufacture coming into the works, and also for the quality of the finished products. Such responsibility should have a very wide interpretation, probably wider than many chiefs of laboratories would like to see. It should not merely consist in writing out analytical reports and consigning them with a sigh of relief to some poor overworked works manager. Such procedure usually results in their being lost amongst other documents which are apt to accumulate on his desk. Properly interpreted there can be no question as to the utility of analyses, and wrongly interpreted they are worse than useless because they mislead, and the proper interpretation of analyses can only be done properly by some responsible member of the laboratory staff. I remember some time ago listening to a most interesting lecture on "The Worries of a Works Manager" before one of our engineering societies. The lecture was quite a long one, but in spite of this there was no mention of the interpretation of chemical analyses. In cases of doubt as to the quality of raw materials it should be one of the duties of the laboratory to take up the question directly with the suppliers, and not through the intermediary of a third party. Then less would be heard of such foolish actions as the rejection of a batch of material because analysis shows it to contain 0.033 per cent. of a certain impurity, while the specification demands that it shall contain not more than 0.030 per cent. Such an arrangement would prevent woeful misinterpretation of results, and incidentally would cut down the amount of transport carried out on the material, for there can be no doubt that such material frequently finds its way back again to the user, disguised under another batch number—a fate it so justly merits after rejection

*Paper read before the Institute of Metals on Wednesday, March 20, 1919.

on such trivial grounds. In addition there is the added advantage that the laboratory would take greater care in sampling and carrying out its tests. In cases where works are enabled to afford the luxury of a buyer, such a scheme need not necessarily cause clashing between the laboratory and the purchasing department. Their duties should be clearly defined; the laboratory should control quality, and the purchasing department should control prices after the quality has been settled. In a good organization there is ample scope for both departments, and they should be encouraged to work in closest co-operation. It frequently happens in a works that unnecessarily high prices are paid for certain materials because of groundless fears of using cheaper ones, whilst on the other hand false motives of economy in purchase often lead to vastly increased costs of production. In this respect the laboratory can be of immense practical use in making a study of the effects of variation in composition and physical condition upon the costs of production, and for this purpose a knowledge of prices is absolutely essential.

Another function of the laboratory should be to carry out research with the objects of discovering new products and processes and of introducing improvements into existing ones, and this function is the one most likely to appeal to the trained scientific mind. This branch of the work will include the investigation and rectification of faults. The last function is one which has already been dealt with by Mr. Barclay, and is the one which gave rise to the controversy in the discussion of his paper. Direct control should be exercised over all processes of a purely chemical or metallurgical nature, such as smelting, refining, remelting, annealing, heat treatment, electroplating, and so on. The determination of the extent to which the laboratory should exercise control is a very moot point. Certainly the laboratory should determine and directly control the methods which are to be adopted, but as to whether it should go further and control the questions of labor and costs is a very difficult question to answer at the present time. It depends so much on the personality of the laboratory staff. In the present state of evolution there can be few highly-trained scientific workers who have had the necessary years of experience to deal adequately with the thorny problems of labor. But the time will surely come when the complete control will have to be placed in the hands of the laboratory —the laws of evolution demand it. At the present time, however, there are very few works laboratories which have evolved sufficiently to take complete control, and it would not be fair to them to add to their already multitudious duties. But it is not so much the object of this paper to dilate on the possibilities of works laboratories as to indicate to them, and also to manufacturers, the methods by which those possibilities can be developed. The possibilities of a works laboratory are unlimited if the conditions are right and its work is allowed to develop on natural lines. Swamping at the outset is fatal.

Now there is a desire on the part of manufacturers to possess laboratories with an efficient staff, and there is the will to succeed on the part of the staff. So long as the two can adopt the right attitude towards each other success is assured. Right from the outset the laboratory staff should recognize that the works is not a philanthropic institution. The success of the laboratory depends upon its being able to turn its activities and accumulated knowledge into money, and is not in any way proportional to the product of the number of chemical estimations and the number of mechanical tests it can do in a specified time. Nor is success even determined by the sharpness and beauty of its photomicrographs. They are facetiously compared with the moon. The laboratory must be a really live institution, with a determination to get right down to rock-bottom facts. It does not assist the man in the works in the slightest degree to receive a report typed on a fancy sheet of paper over a flourishing signature explaining that a certain piece of metal has failed because "a microscopic investigation under a linear magnification of 1,000 diameters, of a longitudinal section after etching in a 2 per cent. solution of metanitrobenzol - sulphonic acid in iso-amyl alcohol indicates that the 'gamma' solid solution has not completely split up into the 'alpha' and 'beta' phases." Unless the laboratory can determine the real cause of the failure and indicate how such defects can be avoided in future, it has failed in its functions. It must get into touch with actual working conditions, learn the language of the works, and exert a friendly educating influence. Its attitude towards the workmen must be a sympathetic one, and endeavors should be made to bring about improvements by assisting the natural processes of evolution which we cannot fail to see going on around us. The writer of a leading article in "The Metal Industry" has pointed out that "a great deal of harm has been done in the past through the scornful contempt with which many skilled workmen have been regarded by enthusiastic university men and chemists." Rather should they marvel that such progress has been made under such trying conditions. There are always good reasons for carrying out operations in a certain way, although there may be still better ones for doing them in different ways. The resentful attitude towards changing long-established customs is a perfectly natural and honest one, and Mr. Heathcote was quite right in regarding with suspicion the man who does not start off by opposing suggested alterations. Experience is a most valuable factor and should be given most serious consideration, and until the laboratory has gained the confidence and co-operation of the practical man it has still a long way to go before it can reach the pinnacle of its utility. The practical man can give invaluable help in working out little details which are essential to the success of any scheme, and once his confidence is gained he becomes a most useful constructive critic. Not that there is any truth at all in the mouldy old adage, "an ounce of practice is worth a ton of theory." This is usually the last resource of the individual whose reasoning faculties are exhausted. The age when theory and practice were considered antagonistic is as dead as the dodo. Theory and practice must work hand in hand, and if the practice is successful and the theory does not fit in with it, then must the theory be "modified" or consigned to the scrap-heap, where it will not be lonely. The staff of a laboratory must get out into the works and make a detailed study of things as they are and why they are as they are, for only in this way can any real and lasting improvements be effected. It is frequently thrown at scientific men in general, and the chemist in particular, that they are woefully lacking in tact, sense of proportion, common sense, knowledge of the human element, and so on. But all these faculties can be acquired to a very large extent, and the method of doing it is to practise self-control. A man who can manage himself is on the right road, and has made a good start towards the management of others. The main value of experience lies in the knowledge of the human element which can be gained thereby.

In the discussion of Mr. Barclay's paper, Mr. Heathcote very wisely pointed out that when a laboratory is installed in a works, not only is the laboratory being tested, but simultaneously a test is being made of the fitness of the works to possess a laboratory, and very frequently the failure or incomplete success is due entirely to the attitude of the works. But it is not intended to arraign manufacturers for their past sins—it would take to long. Past sins are generally the result of ignorance, and the time will be much better spent in attempting to educate manufacturers in the way they should use a laboratory, and the treatment which they should mete out to it. Just as a plea has been put forward to the laboratory to adopt a sympathetic attitude to the works, so must the works extend a sympathetic and welcoming hand to the laboratory. The manufacturer must be imbued with the right scientific spirit, and must be prepared to take the laboratory into his fullest confidence. It must be recognized that the task set is a most complex and difficult one, and one which is not rendered simpler by the fact that its activities are bound to meet with a certain amount of opposition born of prejudice. The scientific worker must be given a status which is at least equal to that of the barrister, lawyer, or doctor. And, after all, why should it not be so, for is not his training as rigorous? The manufacturer must recognize that to the scientific worker a knowledge of chemistry, physics, the principles of engineer-

ing, mathematics, metallurgy, drawing, geology, and modern languages are absolutely essential. Is the man who has the intellect and patience to acquire a knowledge of these subjects to be treated lightly? Mr. Heathcote was quite right when he said that omniscience was demanded of a works chemist. Under existing conditions a chemist was expected to possess, in addition to his knowledge, common sense, adaptability, powers of observation, intuition, and a hundred and one other faculties which are commonly regarded as the gifts of nature. If he does not happen to possess them he is voted a failure and treated with scorn. To a very large extent the scientific worker has never been given the opportunity to develop these faculties. How often is the complaint heard that a chemist of undoubted ability, able to make important discoveries and is yet incompetent to put them on a sound commercial basis. Should this count to his discredit? Certainly not, particularly when it usually acts to his own personal disadvantage. Business ability should no more be demanded in a scientific investigator than should scientific ability be demanded of a sales manager. The very existence of commercial ability almost postulates an inferior degree of scientific ability, because commercial ability demands as its reward financial success, which has certainly not been afforded by a scientific career up to the present. The application of science to industry is in the process of evolution; at the present time the demand for the scientific worker exceeds the supply, and the best way out of the difficulty is for the manufacturers themselves to take a hand in the proper training of promising material. Then we shall hear very much less of the ineffectiveness of the scientific worker, because the manufacturer will take care that the product he has helped to mould shall have suitable opportunities to develop those faculties which the chemist is blamed for not possessing. In the past low wages to the chemist have been the rule. Considerable complaints have been raised from time to time against this, but it ought to be more widely understood that the scientific worker's objection is not so much against low wages but against the fact that his abilities have not been given proper scope so that he could prove his true economic value. Modern industrial conditions demand capital, brains, and labor, and the impression that they are antagonistic is just as fallacious as the idea of science opposing practice. Rightly or wrongly, there is a considerable feeling in the country that in the past more than the due share of the reward has accrued to capital. Already there is a movement on foot for a closer union between labor and the brain workers of the country The best and most lasting reforms are those which come from within—a fact which capital would be very wise to take to heart. But this is diverging somewhat from the subject, but in regard to the question of financial reward it is important to bear in mind that it is most desirable that the possibilities for the scientific worker in this respect should be such as to attract the highest type of brain into the profession. Another important point is that the laboratory staff should consist of a sufficient number of men of the right type, men of proper training, to take advantage of the opportunities to be offered to them. And even when all these things have been attained the laboratory must not be expected to perform miracles in the tying of a cravat. The development of new, and the improvement of old, processes demands research, often of a most intricate and difficult nature, and it is given to few manufacturers to realize the difficulties of research, even when the research is assisted by the element of luck. The completion of every piece of research renders succeeding ones more and more difficult, and it must not be forgotten that once a research is brought to a successful issue its results stand for all time.

The success of a laboratory depends therefore on:—

1. Possession of a proper equipment, which includes an ample number of properly trained scientific workers.

2. Mutual existence of the right attitude of mind between the works and the laboratory.

3. Complete confidence and sympathetic assistance of the management, more particularly with regard to those matters requiring what may be described as commercial ability for want of a better term.

It is not intended to say very much with regard to the training of chemists, although it is pretty obvious that this will exert a large if not deciding interest on the degree of success. The subject was very thoroughly threshed out in the Journal of the Society of Chemical Industry in 1908. Difficulties have arisen in the discussion of the subject, because manufacturers complain of teaching institutions being too academic and expect them to turn out finished technologists. Even if this were possible, it would take from ten to fifteen years, during which time the opportunity of becoming acquainted with the human element is cut down to a minimum. Teaching institutions can do their best work by giving their students a thorough groundwork in the fundamental principles of chemistry on a very broad basis. This in itself is no light task, demanding as it does a contemporary grounding in general physics and mathematics. A man with a good all-round training will be competent to take a post in any of the numerous branches of industry. At the conclusion of the training, which will take three years at the least, a certain amount of original research work should be necessary for the granting of the diploma. The final training of the trained chemist into a technologist cannot be carried out in a teaching institution. The necessary practical bias can be introduced into training by the introduction on to the teaching staff of highly qualified men who have made good in industry, and by insisting on the necessity for real practical experience on the part of the teachers. Serious consideration should not be given to the charge that chemists lack commercial and controlling ability. Up to the present time they have had little or no opportunity of demonstrating whether they possess it or not. If it so happened that some particular individual did not possess such ability, it is certain that he would be given neither chance nor assistance to develop it. If the desire of industry for the assistance of scientific knowledge is real its duty is clear. It must take a definite and positive interest in the training of the potential technologist, not only in assisting teaching institutions, in the acquirement of a staff, but also in promoting and influencing research. But certainly its most important function lies in the direction of the provision of adequate scope and opportunities for the industrial laboratories.

STORING AIR IN THE EARTH

A novel method of providing a receiver of unusually large capacity for compressed air was described by Mr. N. Knapp in the course of the discussion of a paper on natural gas storage, read before the American Institute of Mining and Metallurgical Engineers. Mr. Knapp required a supply of compressed air for working pumps used to raise oil from wells and for blowing out the oil from the wells directly. He connected up an old exhausted well to the air compressors, and for a period of seven years used the well as an air receiver. With this storage system, many times the capacity of the air compressor could be used for short intervals without any appreciable loss of air pressure, and when no air was being used there was no appreciable gain in pressure. Two two-stage compressors were used with approximately 200 horsepower gas engine capacity, running twenty-four hours per day. The original rock pressure of the depleted sand was 305 lb., and the open flow capacity of the well as a gasser was about 2,000,000 cubic feet per twenty-four hours. When the air was pumped into the well, the gas had been used down to a rock pressure of 115 lb., the production was small and the gas was wet and troublesome to use. In the course of a few months' use of the compressors, a rock pressure of 290 lb. of air was developed and there was no water trouble. The extent of the sand used for air storage was small, probably not over 20 or 25 acres, as shown by dry holes and exhausted wells. The thickness of the porous gas sand probably did not exceed 7 ft. The occasional gas sands of this region, Mr. Knapp imagines, were like isolated hillocks of sand resting on the salt-water sand that underlaid the whole country. The depth to the gas sand was about 800 ft., and it underlaid the oil sand.

WHAT OUR READERS THINK AND DO

PULLING HOOK, WHICH PREVENTS SMASHED FINGERS

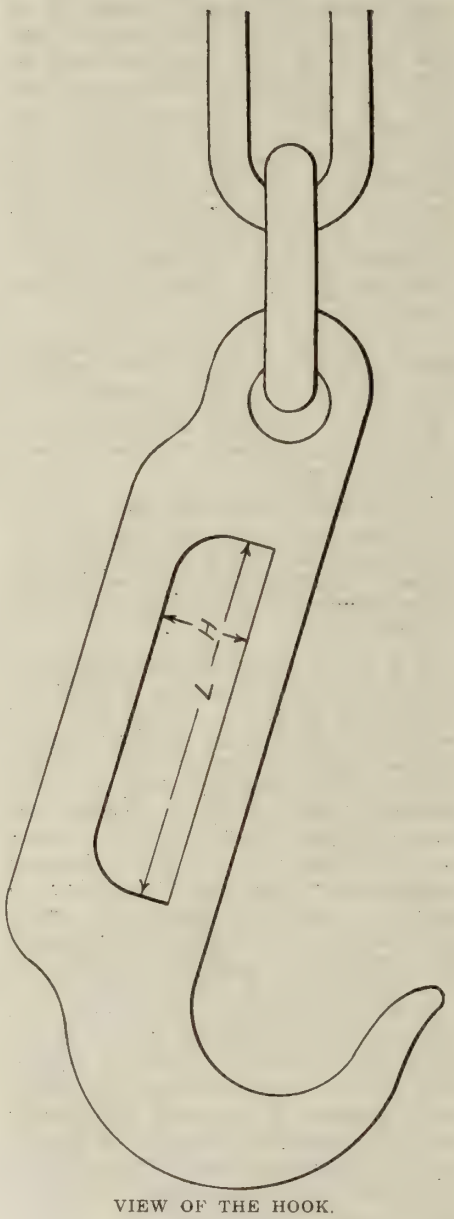
By S. T. Barnum

(Copyright. All Rights Reserved.)

When hooks of the ordinary design are used on the end of a chain or line for pulling things around by power—by horsepower, cranes or hoists—accidents occur frequently. The man whose work it is to engage the hook in the object to be pulled becomes careless and, in an endeavor to catch the hook in the hole which is to receive it, will—as the pulling line is being drawn away from him—take a chance and try to effect an engagement "on the fly." Sometimes his hand may be wedged between the hook and the object and smashed fingers will result. Occasionally the fingers thus injured must be amputated.

With a hook made in accordance with the design suggested in the illustration, such accidents are, largely, prevented. The "safety first" hook shown has a finger hole whereby it may be held and which disposes the fingers in such a position that they are not likely to be caught and mutilated.

The proportions of such a hook should vary in accordance with the work to be handled. For heavy work a relatively large hook is, obviously, necessary, while for light pulls a small one will suffice. In any case, the length of the finger opening (L, Fig. 1) should be sufficiently long, about 4 in., so that the fingers may be readily inserted in it. Correspondingly, the height (H, Fig. 1) should be at least 1½ in. Satisfactory hooks of this character, where the service is not too severe, may be cut and forged from sheet steel plate.



VIEW OF THE HOOK.

TO STRENGTHEN AN AXLE BY REMOVING METAL

By A. J. GRAY

We were having continuous trouble with the axle of a logging car. The axle apparently gradually fatigued and broke off on the outside of the bearing close to the collar as shown in Figure 1.

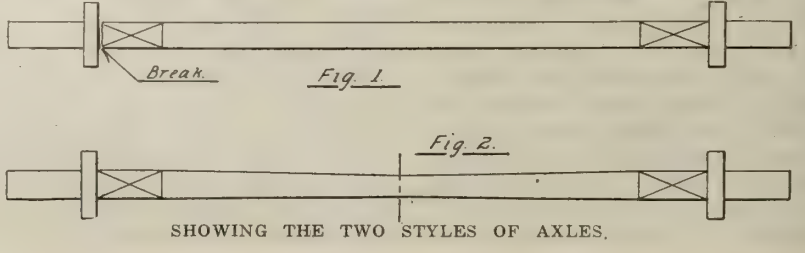
The roadway is not as smooth as might be, and the continual pound had a hammering effect that caused the break, in spite of the fact that the axle had a more than sufficient factor of safety to take care of all the dead load.

The trouble was remedied by tapering the axle to the centre, as shown in Figure 2.

The explanation of the fact of removing the metal from the centre of the axle having a strengthening effect is found when it is understood that the reason for failure was the hammering on the axle caused by the poor road-bed. The force tending to cause fracture would be the foot-pounds of energy that has to be absorbed at the neck of the axle where the break occurred.

Energy is a combination of two factors. That is, energy = force × space. It will follow that the greater the space moved through the less will be the force of resistance caused in absorbing the energy.

This explains the fact of the axle as made to Figure 2 being the strongest, as in giving slightly at the centre it allows more give at the neck, which is equivalent to a greater space moved through to absorb the same amount of energy of the pounding, thus producing less strain in the metal of the axle.



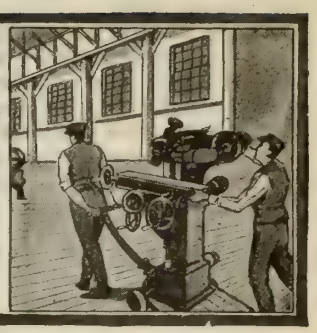
SHOWING THE TWO STYLES OF AXLES.

VENTILATING OLD BUILDINGS

Many times the ventilation of a factory is not considered when the building is built. This is particularly true of old buildings. In other cases a top floor, which has always been in use as a warehouse, is necessarily turned over to factory purposes. In such makeshifts, light and ventilation are often inadequate.

In one plant, the top floor of which was not well ventilated, the heat during the summer months prevented the workers from applying themselves steadily. To better this condition large square shafts or pent houses were built in the roof. Each of these shafts was about 20 feet square—the size of a bay. They were fitted with windows which could be easily opened, thereby making not only excellent ventilators but also letting in much natural light. The fresh air and light improved working conditions by reducing discomfort.

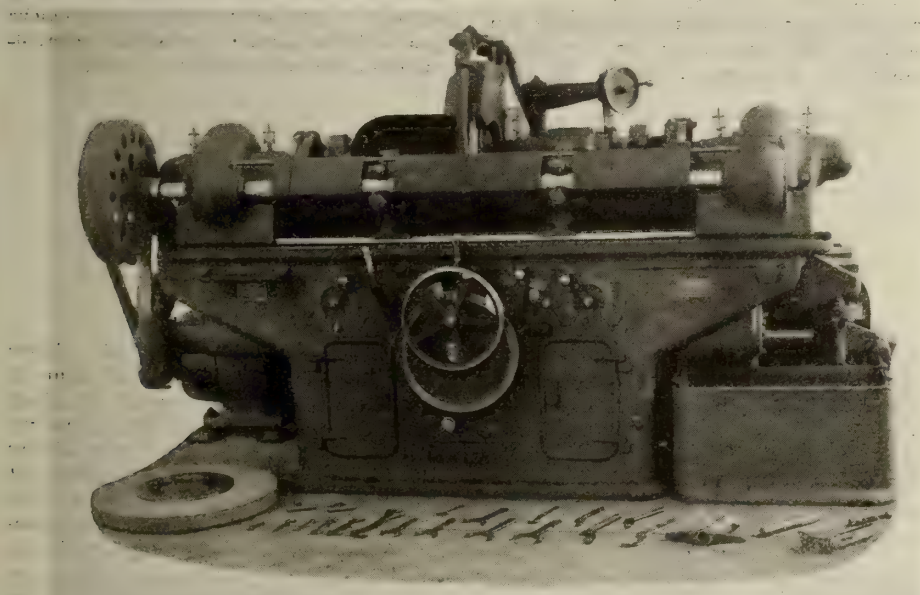
DEVELOPMENTS IN SHOP EQUIPMENT



LANDIS GRINDER

A VERY rigid type of machine, built for accurate crank pin grinding on airplane, automobile and other gas engine shafts. No offset centres are required with these machines, the work being held by quickly-operated holders at both ends.

The crank shafts are driven from both ends, the right-hand and left-hand crank heads being geared together. The different throws are obtained on the adjustable heads from a sliding adjustment of the crank carrying fixtures which are mounted on the ends of the crank head spindles. This is micrometer adjustment,



GENERAL VIEW OF MACHINE.

operated by a screw and having a graduated dial in connection with it.

For multiple throw shafts, the pins are ground in exact relation with each other, and to accomplish this, one of the carrying fixtures is provided with a gauging block, made to suit the throw angles of the crank shafts.

The crank-carrying fixtures will be equipped with a swiveling index, when preferred to the standard gauging block. This swivel is graduated to give all of the regular throw angles. Also, when desired, fixed throw heads will be furnished instead of adjustable heads. For manufacturing large quantities of crank shafts having the same throw, the fixed throw is often preferred.

Accurate alignment of the crank carrying fixtures is accomplished by a simple adjustment of two screws carried in the hub of the spindle gear mounted on the spindle in each head. Another function of these screws is to hold the gear in a positive relation to the shaft, taking the place of the customary key. When the crank heads covers are removed these screws are easily accessible. Counter weights for the work are fastened to each side of the spindle gear, between the spindle bearings, and in a position where they will not influence the end of the spindle.

The crank head spindles are large in diameter and are provided with long phosphor bronze bearings, which are adjustable for wear. The spindle gear is mounted on a tapered portion of the spindle between the spindle bearings. This arrangement eliminates the possibility of influencing the end of the spindle through the spindle drive and also permits the mounting of work carrying fixtures directly on the end of the spindle and close to the spindle bearings.

The rigid main drive shaft operates the crank heads through a steel sleeve carried in each head, and the gear that drives the large spindle gear is mounted on this sleeve. The driving shaft and sleeves are fitted together with taper keys. When it is desired to slide the heads along the shaft to suit the length of the work, the taper keys are released by a simple screw adjustment, after which the keys are again tightened, thus doing away with the possibility of play between the shaft and sleeve. These taper keys can also be used for securing a fine adjustment when aligning the two crank heads.

The driving sleeve is mounted in bronze bearings, one at each end of the sleeve, and the driving gear is mounted on a taper between the bearings. The gear is drawn up on the taper by a nut on the sleeve, effectively preventing any looseness between the joint. This gear, like the spindle gear, is also fitted with adjusting screws instead of a key for positive location of the gear on the driving sleeve. Both gears in the crank heads run in an oil bath, thus creating smooth action and prolonging the life of the gears.

The work table swivels for grinding tapers.

The work speed changes are made by the shifting of a belt on cone pulleys, through the movement of a single lever.

The grinding wheel head is massive and rigid and mounted to slide on a large V and a flat guide. The spindle is of special steel and runs in bronze bearings which are adjustable for wear. The grinding wheel driving belt is always kept under uniform tension by an automatic tightener, which also takes up the stretch of the belt.

Feeding of the grinding wheel to the work either by hand or automatic. The automatic feed can be set to reduce the diameter of the work from .00025 in. to .007 in. at each reversal of the wheel carriage. The machine is equipped regularly with hand feed only, and the automatic feed is furnished when specified.

The grinding wheel traverse feed is automatic, and all of the respective speeds are obtained by the shifting of a belt on cone pulleys by the movement of a single lever. The grinding wheel tarries automatically at the reversing points, permitting the wheel to grind itself clear at shoulders before reversing.

A spacing bar arrangement for quickly locating the grinding wheel to suit the crank pin locations is supplied with the machine when specified. This device is a great time saver when grinding the same crankshaft in large quantities. The same machine can be equipped with spacing bars for several different types of

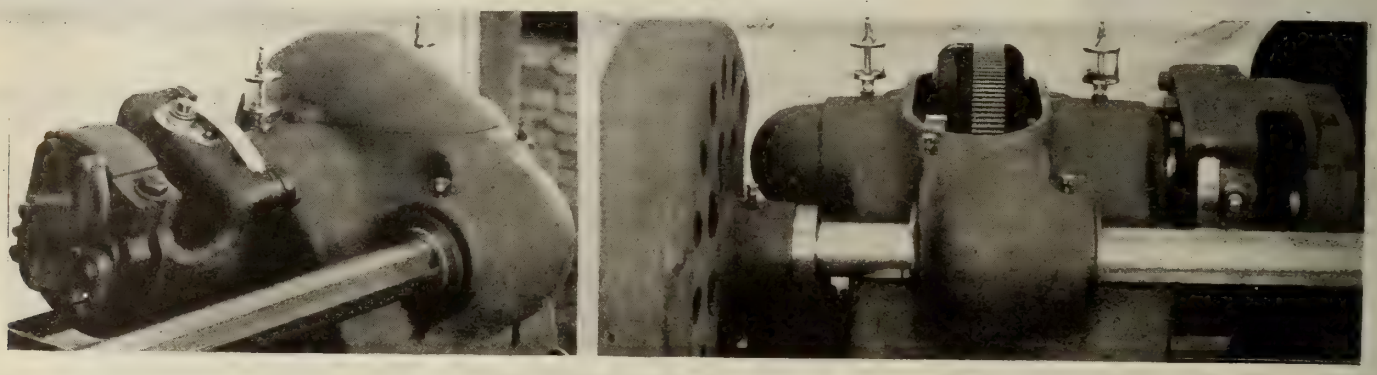
crank shaft as it is very easy to change the spacing bars.

All crank-grinding machines are provided with a lever for connecting and disconnecting the carriage traverse. When spacing bar arrangement is included, this lever has the additional function of engaging the plunger in the spacing bar slots. The spacing bar and the power wheel traverse cannot be engaged at the same time. The crank grinding machine, whether with or without spacing bar, is always provided with a safety device for preventing the power traverse to run into the crank shaft.

The grinding wheel truing fixtures regularly furnished, are used for truing either the face or sides of the wheel. A radial wheel truing fixture, which is suited for truing the face of the wheel, also for forming corners to an exact radius for grinding fillets up to ½ in. radius, will also be provided on special order.

The rests support the work at two points, in front and underneath. The supports are adjusted independently of each other, which is essential to grinding work true. The support adjusting screws have stops which can be set to limit the movement of the rest jaws.

The pump is of the centrifugal type, the bearings of which do not come in contact with the water. The case in which the fan revolves is always immersed, hence no priming is necessary.



TWO CLOSE-UP VIEWS OF MACHINE.

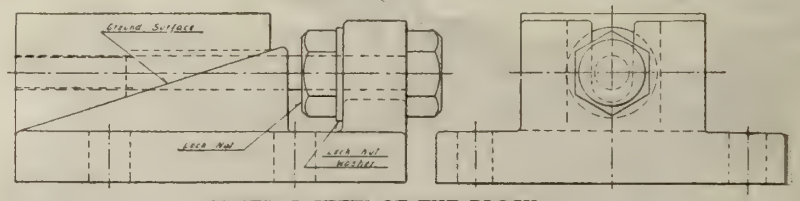
MANHATTAN UNIVERSAL CASTING GRINDING MACHINE

THE Manhattan Machine and Tool Works, 42-50 Market Ave., N. W., Grand Rapids, Mich., has recently placed on the market the universal casting grinding machine shown in the illustration. It is stated that the machine is easy and rapid to operate under the varying conditions such as are met in everyday use, and that its rigidity, strength and flexibility are notable features. The universal movement is obtained by a universal coupling and sleeve, which gives a freedom of movement without undue loss of power. The long handle gives the operator a good leverage, so that the pressure applied to the grinding wheel can be easily regulated. Lubrication is taken care of by wick oilers and drip cups. The standard equipment consists of countershaft, counterweight, two pulleys for the counterweight cable and the machine itself.

GENERAL VIEW OF THE MACHINE.

CINCINNATI PLANER LEVELING BLOCK

An improved type of leveling block for use in setting up planers has recently ben placed on the market by the Cincinnati Planer Co., Cincinnati, Ohio. It is a matter of general knowledge that a planer must be set up on a perfectly level and rigid foundation in order for it to continue to give satisfactory service; and under the severe conditions of load and vibration to which the foundation blocks used for supporting machines of this type are subjected, trouble has often been experienced through their showing a tendency to shift, even where the precaution has been taken of grouting the blocks in concrete. Any such shifting of the blocks upon which a planer is mounted naturally throws the machine out of level.



GENERAL VIEW OF THE BLOCK.

The new style of Cincinnati planer leveling block is so designed that it eliminates the cause of trouble to which reference has been made. This improved block consists of a baseplate and a sliding member which is actuated by a draw-bolt that is furnished with a thread of fine pitch, a lock-nut and a washer. The baseplate is cast with a wide flange, and it is drilled with four 1-inch holes which are found to be of great assistance in helping to grout the block in place. The inclined surfaces of both the baseplate and sliding member are ground to a perfectly smooth surface, so that they slide freely on each other; and this feature in conjunction with the fine pitch of the thread of the draw-bolt greatly facilitates the making of accurate adjustments. The draw-bolt is ⅞ inch in diameter and it is threaded for practically its entire length in order to accommodate the lock-nut. The design of the block is worked out in such a way that 2½ inches of the thread on the bolt are engaged at all times, so that ample holding power is assured. With a block of this kind, accurate settings can be easily made, after which the lock-nuts are tightened so that vibration will not tend to cause the blocks to shift and throw the planer out of level.

Worth-While Information From Many Points

In one second an auto traveling at 20 miles per hour will cover a distance of 29 feet, at 25 miles 36 feet, and at 30 miles per hour 44 feet will be covered.

Look out for doctor fees soaring in the near future, now that a start has been made in using an airplane for professional calls. Dr. Frank A. Brewster, of Beaver City, Neb., as the distinction of being the first physician to adopt this method of transit.

* * *

The tallest people in the British Isles are to be found in the district of Galloway, in South Scotland, where records of the stature gives an average height of five feet ten inches. The shortest stature is found in Wales and southwest England.

* * *

Half a mile underground in a Western mine there is a large blazing electric sign, which simply shrieks at you the words "Safety First." You cannot help but pay attention to this warning, for the fact that you are down in the bowels of the earth sort of brings to your mind the extra need of care.

* * *

The manila hemp, or abaca, as it is known in its native land, is a great source of income to the Philippine Islands. The sum received yearly from its sale amounts to $20,000,000. The hemp, of course, is used in making the better class of rope, usually known as manilla.

* * *

Tanks have had some funny uses, but listen to these: At Brest, American soldiers turned the sod for tennis courts with the aid of a tank. At London, tanks made ideal grandstands; while last, but not least, at Limerick, Ireland, tanks were called out to preserve the peace while the remains of a Sinn-Fein hunger strike was carried to the grave.

* * *

Since the armistice brought hostilities to an end it has been learned that the morale of the popu(lation of Lille was maintained by news given from a French wireless station hidden from the Germans, according to "Wireless Age." Good news spread quickly through underground channels. The people knew that 10,000 American soldiers were arriving daily. Airplanes also dropped many leaflets, which were eagerly taken despite German efforts to prevent their distribution.

* * *

After the electrically heated clothes for airmen comes the electrically heated quilt for hospital patients, and invalids taking outdoor treatment. Very fine and pliable resistance coils are used, and it is said that a temperature of 90 degrees can be obtained in half an hour, and maintained continuously thereafter with a small expenditure of current.

* * *

Recently a baby tank started out in the interest of the American Victory Loan to reach the summit of Pike's Peak In many places it encountered drifts of snow ten feet deep. The tank itself weighed 13,600 pounds, yet still plowed merrily on until a tract plate broke. This finished the trip, so, although they did not reach Pike's Peak, they did the other thing, namely, bust.

* * *

On the sead bed at the head of the Persian Gulf, deep under many fathoms of salt water, there are springs of pure, clear, fresh water. Divers, with goatskin bags, descend and bring this to the surface, their equipment being the same as that of the pearl fishers. This is a stone to sink them, held between the feet, and the ability to stay under water from 2 to 3 minutes without injury.

* * *

The best way to save small pieces of magnet wire, which have served their purpose in connecting some apparatus, is to coil the wire in the form of a spring closely wound on a pencil or some similar object. When ready for use again, the coil of wire can be stretched to the required length. The spring of wire helps to make better contact. Connections made in this manner are also much neater than when the wire is strung out haphazardly.

* * *

To fasten the loose end of a spool of magnet wire, double back enough of the loose end to reach around the coil, stick this doubled back end through the loop formed by the doubling and bend over. This is a much better way to keep the wire from uncoiling than merely raising a turn slightly and sticking the loose end under it. If a kink appears in the wire, it should be carefully straightened before proceeding.

* * *

The "Daily Mail" reports that on September 22nd last, direct wireless communication between Great Britain and Australia was established, when two messages from the Premier and from Sir Joseph Cook were received by the Amalgamated Wireless Company of Australasia from the new station at Carnar. It is stated that the messages received at Sydney were perfectly clear and distinct, despite direct transmission over 12,000 miles.

* * *

The war has shown the Australians that they have capabilities which were never used in pre-war days. They are now manufacturing clothes and boots of an excellent quality at prices about 33 1-3 per cent. less than the same quality of goods made in Canada and the United States. The cloth is of a soft, smooth texture, containing a large percentage of pure wool.

* * *

H. H. Kohlsaat, one time owner of the Chicago "Times-Herald," was one of the first public men on this continent to interest himself in the automobile, and in the summer of 1895, offered prizes for the purpose of "promoting, encouraging, and stimulating the invention, development, perfection, and general adoption of the motor vehicle." He offered prizes aggregating thousands of dollars, and the prizes were based on the following: (a) practical construction; (b) speed; (c) cost; (d) economy; (e) general appearance.

* * *

There is now invented a machine that pulls flax mechanically. This is an English device and can be operated by horsepower or tractor. It looks like a huge sprocket, with the circumference braced by three powerful iron spokes, and a caterpillar tread running out to a smaller sprocket. As it rolls forward the machine gathers a section of the standing flax plants. The seed bolls come between two prongs. The diggers now penertate the soil and tear up the plant by the roots. Next the uprooted flax is carried over top of machine to an endless belt, which rolls the flax over until it drops on the ground behind. There it is left to dry.

* * *

Thomas A. Edison, the electrical wizard, was the first well-known American to prophesy that the automobile would revolutionize transportation. Nearly twenty-five years ago, he is quoted in a New York paper as saying: "Ten years from now we will be able to buy a horseless vehicle for what you would have to pay to-day for a wagon and a pair of horses. The money spent on the upkeep of the horses will be saved. A great invention, which facilitates commerce, enriches a country just as much as a discovery of gold." Looking back from the pinnacle of 1919 automobile development, it must be a source of great satisfaction to know his prediction was conservative rather than radical.

Go It, Governor!

ON the Fourth of July speech-making is as great a national industry in United States as it is in Orange centres here on the 12th of the same month.

And so it was that Governor Coolidge, of Massachusetts, in his home town of Northampton, on July 4, said this:—

> "The Americans are not a fighting people, but when there is a just cause they answer the call, and take up arms for the right. **We have saved France, rescued Belgium, defended Italy, and saved England its one thousand years of civilization."**

Good boy, Governor! In the words of the small boy, you were going some!

But, say, Governor, did it ever occur to you that brainier, brighter and bigger men than you have long since ceased any show of boasting? The nations that paid the awful price for world freedom are bowed in solemn and magnificent thanks, all too eloquent to permit of any loud-mouthed explosions.

Helping Coal to be Dear

ALREADY the public are being told that coal is going to be very dear this winter, and also very hard to get.

This would take place likely at any rate, but the education of the public must go on, apparently, through the insertion of such news. It may interest readers to know they will be mulcted an extra four or five dollars per ton for their coal this winter, but it also helps to make the way easy for all and sundry who have to do with the setting of the price.

The truth is that the prices will get up high enough without any tinkering assistance on the part of the press.

Already officials of the U.S. Government are quoted as follows:—

> "Coal men fear the situation may get away from them, and that prices may rise five or six dollars a ton."

If there is a danger of the situation running wild, the Government can check it if it so desires. During the war the price of pig iron and steel started to run wild. The Government found it easy enough to fix the price of iron and to say that 3c should be the outside figure for ship plate.

Any sort of a nag will run away if they take off the halter, show it a lot of green grass and oats ahead, and then hit it a kick. In fact, a nag that would not run under such circumstances would not be worth worrying about.

Coal companies and kindred agencies are somewhat the same. Take the restraint off, show them where they can bulge with money, and let the dear general public start to clamor for coal.

Will prices go up under such circumstances?

Just as sure as the nag would bolt for the hay and the grass in one case, the prices will bolt for the higher peg in the other.

Henry Ford in Court

IN a large number of the daily papers there have appeared editorial comments, some at considerable length, concerning what Henry Ford has said and admitted in the witness box in his suit against the Chicago *Tribune*. No doubt Ford has told enough to make it certain that he is not a keen student of political science nor historical matters.

These articles for the most part are concerned in taking a fall out of Henry Ford, largely because he admitted he did not know at times what he was talking about.

Are there never occasions when the same daily papers discuss subjects in a way well calculated to make the informed reader see they do not know what they are talking about?

Many Canadian editors discuss the problems of the British navy, and many of them have never sniffed salt water.

They pile into long-distance discussions at times of semi-technical matters in a way that shows how barren they are of even the fundamentals of their subject.

Why not take Henry Ford in his own back yard, namely, as a manufacturer and an organizing genius?

Why not take him as an employer who long ago put in a $5 per day wage, then a $6 and $7?

It is somewhat of a knot-hole vision to size up a successful man entirely on a matter and in a field where he is admittedly not a specialist.

IF THAT peace celebration on Saturday could only have included industrial peace as well it would have been a celebration well worth cheering for.

* * *

THE British sovereign is now worth only $4.25 in United States. Rather alarming, but then it's no worse than what has happened to our own dollar. It's wizened up to about 30 cents.

* * *

WHAT kind of men are your apprentices turning out to be? Are they good mechanics? Are they in demand in other shops? Have they gone on to be foremen and superintendents? Look this matter over and remember your shop has a responsibility in connection with every apprentice you turn out. Very often a shop is judged by its graduates.

* * *

CANADIAN MACHINERY'S drafting course had over 20 students sending in their work regularly for examination, and the number is constantly increasing. Some of those following the course are from the Maritime Provinces, Chicago, Hartford, in the United States, and the rest in the industrial centres of Ontario. In many cases shops are subscribing for the paper for their apprentices to study. This we take as the greatest compliment that can be paid to a technical paper.

Is the Draughtsman's Profession Crowded

BY ENGINEER

THE anxious parent, looking for an opening in life for his ambitious offspring, may perhaps be seized with the idea of making him a draughtsman. The profession on the surface looks attractive. The hours are not long, the work is performed amid clean and well-lighted surroundings, and the youth does not have to soil his delicate hands by handling greasy machinery, or heavy tools.

Then, when his apprenticeship is over, he can obtain fairly lucrative work, without much difficulty. When we say fairly lucrative, we mean he can earn a little less than the average machinist, and his status will be, from an employer's point of view, a little below the machinist.

Many employers quite frankly look upon a draughtsman as a necessary evil, and his work as non-productive. in some cases this is true, and the product of the drawing office is more in the nature of a record than a guide. The writer remembers well the case of a large pulp mill, where new gears were designed by the patternmaker, and the sketches for the drawing office made from the finished wheel. The necessary evil was well exemplified in this case. True, the patternmaker could have made the drawings also, but his time was too valuable.

What is the Reason?

The cause of this lack of status of a branch of engineering that should stand high, can be found in two things. One of these is the looseness of the use of the term "draughtsman," and the second is the training or lack of training that the apprentice draughtsman receives.

The dictionary defines a draughtsman as one who draws machinery, or drafts pleas, or generally, one who makes drawings. That description fits the majority of the men engaged as draughtsmen, and therein lies the root of the trouble.

The ability to draw is the first requisite of the draughtsman, but by no means the only one. In the engineering world, the term daughtsman should cover the description of one who can evolve a design, making all the necessary calculations, and having a full understanding of the operations and difficulties of the actual making, from the patternmaker's, molder's, and machinist's point of view.

How many men calling themselves draughtmen can fill the above qualifications? A small minority, it would seem, and these are usually known as designers, not draughtsmen. Here then, we have a distinct branch. Then again there is what is known as the detailer. He takes the general design of a machine or engine, and fills in the details. Then there is the man who never does anything but tracing. These three classes are all too often lumped under the general term draughtsman, and this fact makes it more difficult for the few who are really draughtsmen in the engineering sense of the word, as against the dictionary definition, to get a suitable reward for their abilities.

What is the Training?

Where do all these detailers and tracers come from? They are being turned out daily after spending four more or less valuable years in a drawing office, learning to be draughtsmen (?). What is the usual course of instruction that the apprentice goes through? Different firms have different methods, but a fair sample probably is as follows:—

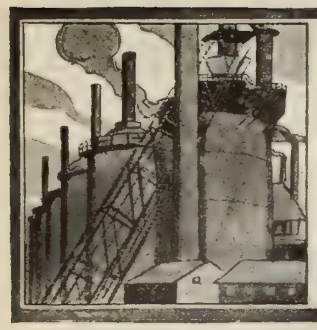
The first job will be filing drawings, and making himself generally useful. He has about one month of this, and on the whole, it is a time well spent, as it will give the neophyte an idea of routine. Then he will spend two to three months on the blue print making, either by machine light or sunlight. The utility of this is open to doubt, if the object of his training is to make him an engineer. A few days to give him the idea of how it is done would be ample, as it is not the work for a skilled man in any case. From this he will go to the drawing board, where he will take up the work of tracing, first small details, and then the general assembly tracings. This work will make him proficient in the use of instruments and teach him to be neat, and he will spend a period of probably one year on this work, perhaps longer.

Up to this time, unless he is ambitious and has an opportunity of attending technical classes, he will have acquired practically no knowledge of the things he is tracing. He may have walked through the shops, and observed different things in the making, and connected them in his mind with the tracings he has been making. Or he may not. It is quite likely no one will bother him enough to find out. However, he eventually gets to the stage of making drawings of details and small sketches, made from the rough sketches of the designers, and from that to the making of assembly drawings. Now after having spent four years of his life, what is he? Not an engineer, not a designer. He may know something about shop work. Quite likely he does not. What will he develop into? If as before said, he is blessed with ambition, he will get out of the drawing office as fast as he can, and get a course in the shops, to find out something of what he has been drawing. He will also take a course of mathematics, sufficient to enable him to grasp the fundamental ideas that make the finished article possible. Most likely, he will remain where he is, and add another unit to the army of necessary evils!

Is the apprentice to blame, or is it the system? Emphatically the system. A boy who is going to become a draughtsman, in the true sense, is going to be a mechanical engineer. Then he should be trained as such. His first entrance should be into the shop, and not the machine shop particularly. He should have an opportunity of a period in the pattern shop, not to become an expert manipulator of a patternmaker's tools, but to find out how patterns for different jobs are made and why. Then into the machine shop, to become familiar with the different machines and their uses, and the particular jobs that can be done in them. The erecting shop should follow, after which he would be in good shape to learn the art of designing. During this time the apprentice's mathematical education should be developed, and after a period of say two and one-half years spent in this way, a further two and one-half years could be profitably spent in the drawing office. This period would be valuable to him, and owing to the knowledge acquired, to his employer. A course of training of this kind would have two excellent effects. It would eliminate quite a number of those who choose the drawing office for its comparative ease and lack of unpleasant surroundings, and automatically raise the standard of those who remain. The employers would know they were getting better men, and the men themselves could organize to improve their status in the engineering world. "'Tis a consummation devoutly to be wished."

Furthermore, a man trained in this way would not be confined to the particular work carried on by the shop he was trained in. His knowledge of engineering practice and his developments of mathematics would enable him with a little study, to take up any branch of engineering design which he might wish to specialize in, or he might develop into an all-round man in all branches of mechanical engineering.

Five years is none too long a time to learn a profession, if it is to be a profession. Furthermore, such a course would ensure that in a short time there would be only one answer to the question of "Is the profession overcrowded?" and that would be an emphatic "No."



MARKET DEVELOPMENTS

Metals Advancing Sharply in Busy Market

All Grades of Copper Go Up This Week—Scrap Dealers Paying Better Prices—The Used Machine Still a Big Factor in the Sale of Equipment

IT is not very often that the scrap metal market is called on to provide the best news for the week, but such is the case this time. The big dealers in Toronto marked the whole list up this week, special attention being paid to anything in the line of copper. The metal market regards it as certain that there will be a big export demand for copper very soon, and as there is not a great quantity being produced owing to labor troubles, the prices are due to go higher. Not only that, there is a demand for scrap metal. The foundries and the steel mills are buying material now and there is a lot of business moving.

Machine tool dealers still have to contend with the problem of getting the buying public away from the used machine tools that came on to the market when war work ceased. Many of the inquiries that come to the dealers contain the request that prices should be quoted on used as well as new machinery. There has been no concerted action on the part of the dealers in regard to the policy to be followed on the taking in of used material. Some firms are always in the market for it, and as a result other dealers, against their wishes, must figure on taking away old equipment if they are going to sell new.

One thing that makes used equipment attractive is the price of the new material. Prices are not far from 100 per cent. above pre-war days, and even now talk comes of increases. Some of the big shops have given a shorter work-day with the old wages, which amounts to an increase in costs, and the makers threaten to pass it on in the way of higher selling figures.

Pittsburgh steel mills report that they continue to work nearer to capacity. Plate is probably the weakest spot in the steel market at the moment. Reports indicate that while 2.65 is the nominal quotation, there are cases where as low as 2.50 has been the price at which a fairly good tonnage would be closed.

MONTREAL REPORTS BUYING IS STILL DONE ON RATHER SMALL SCALE

Special to CANADIAN MACHINERY.

MONTREAL, Que., July 24.—Trade improvement is undoubtedly more general throughout the district, and activity is gradually increasing in volume in the many industries of the country. Labor disturbances are still a factor in business circles, but disputes in the metal working trades are being adjusted to the satisfaction of all parties. The recent strike at the Vickers plant, which has just been settled, will affect the operations to some extent, and fewer launchings will take place this year than were expected. The announcement that the steel plate mill at Sydney will be completed, has created a waning interest in steel circles, but there appears to be few who think it will have much effect on local conditions. The price agreed on by the Government will mean that the output at that figure will almost all be absorbed for Government purposes, as a price of $3.65 is rather high in face of the quotations of the American mills. That this condition may come about is seen in the announcement this week that additional contracts for steel vessels have been made with some of the leading shipyards. Dealers here are more hopeful of the early future than they were a few weeks ago, but no heavy buying, as yet, is coming to the surface, although the regular business is improving slowly, the present demand still being such as to cover immediate needs only. Labor appears to be the keystone of true conditions and unrest must become history before any real signs of concentrated reconstruction will develop. As a dealer here remarked: "This factor of labor is the hinge upon which all things swing. Manufacturers are exhibiting no undue haste in getting back into harness, being content to carry on while these clouds remain upon the horizon. Until some general adjustment is made any extreme signs of exceptional activity might act as a signal for further unrest and demands of workers." Some little business has been done in structural materials, but general activity of a light nature is the rule. Machine-tool demand is quiet, but sufficient to maintain the interest of the trade. Metals show a steady return to normal with the market strong. Old materials are not active, but a light, steady demand is reported.

Copper Strength a Feature

Copper continues to hold the interest of the trade, due to the steady domestic demand and the possible developments arising out of the changed conditions of world commerce. Germany will probably be a large buyer in this respect and copper will be a commodity of which she will require considerable quantity from the United States. With the exception of tin the metal market is quite strong. Brass interests are buying more freely and the demand for spelter is steadily growing. The lead situation here is firmer, following the American advance, but dealers are holding to the previous quotation of 7 cents per lb. Sales are not heavy, but the demand is steady. Antimony and aluminum continue unchanged. All metal prices are firm at last week's quotations.

Scrap Strong, But Less Active

The strength of the scrap market is maintained despite the slight decline in general activity. The iron and steel trade is demanding larger quantities of scrap and the movement appears to in-

dicate that business will be steady from now on. Metal scraps are holding the leading position and buying is on a larger scale than for some weeks back. The fact that trade with Germany is open again and the knowledge that she is depleted of this metal, is a large factor in holding the market at the present high level. No price changes are recorded this week, and the present market is very firm.

SCRAP METAL IS MARKED WELL UP

Biggest Increases That Have Been Registered for Many Months—Peace Signing Has Helped.

TORONTO.—Judging by the way in which the scrap metal market has shoved up prices it is willing to pay for material, the belief is gaining that the turn has been made in the road, and that business is going to get going in earnest. The scrap market can hardly be termed a chronic optimist either, for as a general thing they are not exactly keen to admit that business is good.

It is perhaps hard to lay a finger on specific instances in the markets this week where improvements are in order, or where more business has been done this week than for a certain stated period in the corresponding week. But there is an undoubted feeling in business circles that things are fundamentally strong, and that there is a real recovery in the market. It may be that the signing of peace has had something to do with it, as it means that there are markets open now that have been closed. This has a large effect on the metal markets, especially copper, as it is known that Germany will have to be a heavy purchaser of this metal.

The Second-Hand Stuff

"Look at this," said a well-known machinery dealer to a representative of this paper this morning, as he passed over a request for quotations on a certain amount of equipment.

There was a foot-note that spoiled the business from the standpoint of the keen salesman, and it was this: "We would refer prices on used equipment, as we are told there is considerable of this to be had in very fair shape."

"Some dealers state that they do not have much trouble in meeting the request for second-hand or used material," continued the dealer, "but I can tell you we are up against it all the time on this point, and I am inclined to take with a grain of salt all these statements about not having to contend with the man who has it in his head that the market is full of bargains in machines that have only been used for a couple of days or a week, or that have never been taken out of the cratings at all. As a matter of fact, the best of this stuff has been picked over some time ago, but there are occasional lots that keep coming on the market. We cannot state that this business has been as serious as we contemplated when the war ceased, but at the same time it has been constantly with us. The trouble is that if one dealer refuses to take the used material another comes along who will do business on that line and seems anxious to. If there had been some understanding among the dealers on this point it would have saved a lot of trouble, but it has gone so far now that there is no chance of this. It is not bothering us any more than the rest of the trade, but at the same time we will be pleased enough when the war shop stuff and used equipment idea is a little more backed off than it is now and has been ever since the announcement came that the fighting had ceased."

The automobile business in Ontario continues to buy material. This is not only in the shops where cars are being made, but in repair shops as well. Many of the better garages are in the field, putting in a certain amount of equipment, and in many cases they have taken on machinery that saw some service in the war shops. This is a line of business that is bound to increase. One has only to stop and reckon the number of decent sized garages there are. There is a certain amount of equipment they can readily use, and they are showing a tendency to secure it.

Some slight improvement is noticed in supplies, although it must be said that the volume of business in this department is still light. Many of the shops around here that would, under ordinary circumstances, be large users, are still tied up by the strike, and the every-day wear and tear is absent, so it is that the list of supplies called for for replacement purposes is small.

No Large Buying

Isolated cases are reported of fair-sized offers for plate, tubes and bars, but the buying can still be described as spotty rather than general. A dealer who does a lot of buying in the New York market, speaking to MACHINERY this week of conditions there, stated that he considered plate as the only weak spot in the market at present. He said that there had been a great increase in some districts of plate mill capacity in the war months, and it was a big undertaking now to book enough business to keep up to the capacity. In other lines the markets were particularly strong, and he bore out a statement that was made in these columns a few weeks ago that many of the concessions that had been given for some time past were being withdrawn by the mills, and that further some of the mills were now out of the market, being well filled with orders for some time.

Scrap Market Jumps

It has been months since there has been such a forward movement in the prices of what dealers will pay for material as is announced this week. Some weeks ago Montreal marked material well up, and this week Toronto has gone in the same direction. Some of the more noticeable increases are, of course, taking place in the coppers, which are very strong for the moment. In fact it is not possible just now to contract for fourth quarter under 26c. Light copper is marked up from 12 to 13¾, crucible from 15 to 18. Similar increases are noticed in heavy copper and copper wire. Wrought iron axles are up $5 per ton.

"What's the reason?" was the question that MACHINERY asked this morning when the new prices were announced.

"Reason enough," was the reply. "There is a much better feeling in the market, no matter how you look at it. There seems to be a conviction that things have definitely turned for the better. Business is good, and when we say that we mean just exactly what we say. We are both buying and selling in good volume. Foundries and mills in this country are taking on material more than for some time past. As far as the increases in copper are concerned there is a feeling that Germany will be in the market for a lot of this material, and there is no danger of her dominating the situation. The scrap metal market is better right now than it has been for a long time past," he concluded.

POINTS IN WEEK'S MARKETING NOTES

American Steel & Tin Plate Co. reports that last week was the largest booking in the history of the company.

—

Scrap metal prices have been marked up all around in Toronto markets, and there is a lot of buying and selling taking place.

—

That Germany will be in the market for copper and other metals is one of the reasons attributed for the higher prices quoted.

—

The oil industry is keeping many of the U. S. pipe mills running to capacity.

—

That the second-hand equipment idea still stands in the way of the sale of much new machinery is the statement of one well-known machinery dealer.

—

The demand for structurals is not much improved, while Pittsburgh reports state the demand for plates is wretchedly small in proportion to capacity. As a result there is still a tendency to shade plate prices, and it is stated that as low as 2.50 has been named for some orders.

It is not generally known that an airplane camera weighs forty-four pounds, complete, and is made of aluminum throughout. The lens has a focal length of twenty inches, which means it can take a photograph from a great height without distortion. From 1-90th to 1-30th of a second is the usual exposure given the picture. The film roll is operated by a wind motor, and the film is long enough to take approximately 100 exposures.

PITTSBURGH REPORTS THAT IN SOME CASES AS LOW AS 2.50 IS PLATE PRICE

Special to CANADIAN MACHINERY.

PITTSBURGH, Pa., July 24.—There has been a slight increase in steel mill operations, taking the country as a whole, since the first of the month, when the rate was about 70 per cent. of capacity. That rate had represented a sharp increase, as the low point of the year in operation, about the middle of May, represented barely more than 50 per cent. of capacity.

There have been further gains this month in the volume of orders placed, but these gains are chiefly finished steel lines, upon which mills are already well sold up, and thus the increased buying results more in the piling up of tonnage on books for forward delivery than in an increase in the rate of production. This condition is particularly the case in lap weld pipe and in sheets, though it obtains to a limited extent also in merchant bars.

Unfinished and Finished Steel Capacity

As is fairly well understood in the trade an abnormal alignment exists as to capacity available for the production of steel and capacity for the refinishing of steel, from the ingot or bloom through to the merchantable products, bars, shapes, sheets, pipes, wire, etc. This arises from the steel making capacity having increased 40 per cent. since 1914, largely due to the demand for shell steel, while there was not corresponding expansion in finishing capacity, except in plates. Accordingly it would be difficult for the steel industry to work up to operating at capacity, on the basis of ingot capacity, which is used in figuring the percentages mentioned above, unless the orders for finished steel products were distributed to fit exactly the capacities in the different finishing departments. Some estimates are that with further expansion in demand between 85 and 90 per cent. of the steel making capacity can be utilized.

Mills that have an excess of steel producing capacity are, of course, considering the matter of adding finishing capacity to take care of the additional steel making capacity. The alternative to abandon some of the steel making capacity is altogether unthinkable. A case of this sort is that of the American Rolling Mill Co., Middletown, Ohio, which increased its steel making capacity very considerably during the war, and furnished large quantities of shell steel. This company has adopted plans for extensive additions to finishing capacity, and is now in the market for the requisite buildings, involving 3,200 tons of fabricated steel.

Heavy Bookings in Some Lines

For the last week for which the compilation is available, the American Sheet and Tin Plate Co. reports the largest bookings it has had for any week in its history, barring only one week in the fore part of last year. The compilation refers not to contracts entered but to actual shipping orders entered, including specifications against contracts. The bookings were heavy in both sheets and tin plates. The National Tube Company booked in the first half of July a tonnage somewhat in excess of its entire capacity for a month. In both instances deliveries on most of the tonnage booked will be deferred weeks or months. In some sizes of lap weld pipe orders now entered cannot be shipped before November or December. Butt weld orders, on the other hand, can be filled promptly, and indeed are being filled to an extent from stocks accumulated earlier in the year.

The extremely heavy demand that has existed for months for line piping and other oil country goods is looked askance by some pipe mills as being due to an oil boom that cannot possibly continue indefinitely. It certainly seems strange that there should be so heavy a demand as to fill the lap weld departments of the pipe mills, when other users of lap weld pipe have been buying very sparingly indeed. The attitude is reflected in the failure of other pipe mills to follow the price advance announced early in the month by the Wheeling Steel & Iron Co., 2½ points on butt weld and 5 points on lap weld, about $5 and $10 per net ton respectively.

Demand Spreading

For several months past the condition as to steel demand has been that of certain lines of consumption being very active and others being very quiet, a natural enough situation when the country is recovering from war time conditions, as some lines of activity can return to normal sooner than others. For several months the leading lines in the matter of buying steel were the petroleum industry and the automobile trade. The sheet mills found a few months ago that they were receiving a moderate volume of business in the aggregate, equal, to say, 60 per cent. of capacity, but nearly all the tonnage was from the automobile trade. If their other customers had bought with corresponding freedom the mills would have been oversold. Now the sheet mills find their orders very much better distributed, as all their customers are buying with more or less freedom. In particular there is now a good demand for sheets involved in the building trades, as for instance for sheets for making metal lath.

A similar spread in demand is observed by the merchant bar mills. For a time the only branch of their business really active was represented by their cold drawn steel customers, who were fairly busy making material for the automobile and associated trades. Now, however, other customers of the bar mills have been coming into the market more freely, including the agricultural implement makers and machinery builders generally, while there is a better demand for concrete reinforcing bars.

Demand for structural steel, however, still lags, although it is improving, and demand for plates is wretchedly small in proportion to capacity. Plate mills attached to pipe works have a fair volume of work in making plates for large pipe and there has been an active demand from the oil trade, involved in tanks for oil storage and in small boilers for field work, the kind that can be rolled over the ground by a team to a point otherwise inaccessible. Most lines of plate consumption show decided inactivity, and even demand for shipbuilding is unsatisfactory as the shipyards are still drawing from accumulations. As a result of these conditions the regular or official price of plates, 2.65c, continues to be shaded very frequently, generally by $3 a ton or to 2.50c, while other finished steel products show scarcely any deviations from the regular prices, those that became effective March 21.

Decline in Chain

While the producers of finished steel and the producers of most manufactured steel products, such as rivets, bolts and nuts, cold rolled steel, etc., have been doing team work and holding prices quite well, a disturbance has occurred in the chain trade. The American Chain Co., the largest producer, feeling that it was not getting the share of the total business to which it was entitled, recently made sweeping reductions in prices of ordinary or black chain, much to the surprise of other producers. They accepted the reductions, of course, but for a time considered the advisability of rejoining by making other reductions, as in bright chain, for instance, but this idea was abandoned. The reductions on black chain included a reduction in the base price, on one inch proof coil chain, from 6.50c to 6.75c, reductions also in most of the extras for size, and reductions in the extra for BB and BBB quality, whereby the average reduction on an assortment probably runs from $25 to $30 per net ton.

NEW YORK HEARS INCREASE LIKELY

Special to CANADIAN MACHINERY.

NEW YORK, July 24.—The machine-tool market is making gains in more ways than one. For instance, for some time past the great bulk of the buying has been done by one branch of the industry, viz., the automotive factories. They "came back" quickly as soon as the armistice was signed, and bought heavily. This was true not only of the existing shops, but of factories that were brought into existence after the signing of the armistice. In fact, the auto business has been kind to the machine-tool trade.

One of the best features to come to notice lately is that the buying of tools is becoming more general, and inquiries are coming from a much wider field than formerly.

One New York manufacturer has signed up a good-sized order of 42 large lathes for the Washington naval ordnance plant, the price being close to three-quarters of a million dollars.

French works have inquiries in the market here for equipment for the Creusot Works. It is stated that the erection of a very large steam turbine plant is contemplated.

Cincinnati tool builders, discussing price prospects, state that an advance in some lines is far more likely to take place than a decrease. A shorter working day has been put in force at the old rate of wages. There is a scarcity in some of the shops of skilled labor. This works out in several ways. For instance, New England shops are getting a large amount of work that cannot be handled in the other centres.

FURNACES ARE NOT ANXIOUS TO BOOK ANY BUINESS NOW FOR 1920

SOME very large tonnages of iron have been disposed of at the furnaces and prices show a firmer trend.

Pittsburgh.—The Carnegie Steel Co. has added two stacks, and have thirty-six in blast now, intending to add two more next week. By August 1 this company will have forty of its fifty-nine stacks active.

Boston.—Pig iron trading is dull. Fourth quarter prices look firmer. In spite of high freights southern iron is holding its own in the market here.

New York.—First half of 1920 is being covered now in many instances, and export business is a large factor in the dealings. Another furnace at Port Henry will blow in about the end of July.

Buffalo.—Buyers are wanting iron now where a few months ago they would not take it. Two big interests are out of the market now, showing no anxiety over quoting on 1920 business.

Cleveland.—Makers are now shipping more than their output, which is making a reduction in the stock they had piled.

Chicago.—Deliveries are complained of, and as users have bought short for some time, there may be yards where pig will be out or scarce.

Cincinnati.—Low-priced iron for third-quarter shipment is wholly absorbed. Southern stocks selling at $25 have left the market.

St. Louis.—Furnaces are not trying hard to sell as they can readily dispose of their output. They are not booking for 1920 orders.

THE DEALERS HOLDING THEIR SCRAP AND PRICES ARE CLIMBING AS RESULT

SCRAP metal users in Canada and the United States are coming into the market freely, and prices are stronger.

Chicago.—Scrap of all sorts goes up from 50c to $2 per ton. Dealers are not keen on selling, expecting higher prices.

New York.—Yardmen and scrap collectors are holding back and forcing prices up. Tonnage moving is not large.

Boston.—Large sales are going to stove foundries. This is the best business in scrap metal which is otherwise rather dull.

Philadelphia.—Prices are mounting, but selling is small.

Pittsburgh.—Steel manufacturers are in the market in a large way. At one plant 28 cars were rejected as being below grade.

Buffalo.—Heavy melting is in demand, and dealers are not selling it in quantity. Good demand for all grades this week.

Cleveland.—An offer of $21 delivered has been turned down for heavy melting. Dealers look for a shortage and higher prices as many yards are bare.

STANDARDIZATION OF CHAINS

The unprecedented demands of the Allied Governments for driving chains for all purposes during the period of the war, made it necessary for the British Driving Chain Manufacturers to collaborate in order to use the whole of their resources to the best advantage. As a result, the needs were met, both as regards quantity of production and quality of products. The benefits accruing from co-operation were so marked that a permanent association has now been formed.

The main object of the association is to foster and develop the use and application of chain gearing, the value of which is not yet fully appreciated by power users. In view of this, and in the face of competition with other forms of transmission, it is the policy of the association to keep down the cost of chain driving to the user. This will be attained by:

1.—Standardization of chains wheels and chain wheel cutters to ensure interchangeability.

2.—Elimination of unnecessary sizes of chains, which have been a source of confusion and difficulty to the user.

3.—The increase in output resulting from the above.

4.—The more comprehensive research made possible by co-operation.

The association is composed of the following: Alfred Appleby Chain Co., Tilton Rd., Birmingham; Brampton Bros., Ltd., Oliver St. Works, Birmingham; "The Coventry" Chain Co., Ltd., Spon End Works, Coventry; Hans Renold, Ltd., Didsbury, Manchester.

GRAMMATICAL

Highlanders have the habit, when talking their English, such as it is, of interjecting the personal pronoun "he" when not required, such as "The King he has come," instead of "The King has come." Often, in consequence, a sentence or expression is rendered exceedingly ludicrous, as the sequel will show:

A gentleman of high standing tells us that he had the pleasure of listening to the sermons of an exceptionally clever divine (let his identity and locality remain a secret), and recently he began his discourse thus: "My friends, you will find the subject of my discourse this evening in the first Epistle General of the Apostle Peter, the fifth chapter and the eighth verse, in the words, 'The devil he goeth about like a roaring lion, seeking whom he may devour.' Now, my friends, with your leave, we will divide the subject of our text this evening into four heads. Firstly, we shall endeavor to ascertain 'Who the devil he was'; secondly, we will inquire into his geographical position, namely, 'Where the devil he was' and 'Where the devil he was going'; thirdly, and this of a somewhat personal character, 'Who the devil he was seeking'; and fourthly and lastly, we shall endeavor to solve a question which has never yet been solved, 'What the devil he was roaring about.'"

STORING LARGE QUANTITIES OF COAL

The problem of storing immense quantities of coal—10,000 tons or more—has always been a serious and expensive one. Railroads and power plants, and large industrial plants requiring coke, must always have large coal reserves. Many plants use the bucket and derrick method constantly to move the coal in order to prevent combustion and fire. This describes a method that has proved extremely successful.

The greatest danger connected with storing coal is in the slow combustion which takes place and is not detected until the odor of sulphuric fumes becomes noticeable. When this action begins the coal should be redistributed so that the pressure existing on the heating layer is removed. In some cases the entire coal pile would have to be turned over, since the greatest pressure is on the bottom, thus requiring quick action and the expenditure of a large sum of money. Any scheme whereby an increase of temperature in the coal pile can be detected, or by which it can be retarded or prevented, will therefore be a saving. To accomplish the first objective an electrical thermometer system was installed, with the temperature indicating instrument or pyrometer in the engineer's office. Switches were so arranged that the temperature of predetermined locations in the coal pile could be obtained almost instantly. The second objective was obtained by reducing the pressure on the heated layer, removing all the coal at that particular point if necessary. A temperature of 250 deg. F (120 deg.

C.) was assumed to be the safe internal temperature; if the pyrometer showed a close approach to this figure, the coal at this point was immediately removed to the point nearest the place of consumption. This involved little additional expense in operating costs, as the coal would eventually find its way there anyway. This is not true of the "turn-the-coal-over" method, especially if the storage place is limited.

To keep within the safe temperature limits the coal, as consumed, was removed from the top in two-foot layers with a gradual slope toward the point of consumption. The removal of the two feet of coal reduced the lowest layer from the pressure of the removed weight, and the gradual slope made the work of the men with loaded wheelbarrows less than if a perfect level was retained.

Ten thousand tons of coal piled 12 ft. high meant that a ground area of 33,350 square feet would be required, assuming a value of 50 lb. per cubic foot. A trackage of 400 feet permitted the unloading of coal on a plot 350 by 100 feet. For satisfactory detection of heat changes in the coal to be stored on this plot it was decided to place pyod receptacles (thermocouples) in rows of fifteen. The receptacles were constructed of 1-inch wrought-iron pipe, welded to a point at the end, which entered the coal pile. The exposed end was fitted with a self-closing cap to prevent the entrance of any substance which might interefere with the ready insertion of the pyods. Fifteen pyods were used. The wiring to the engineer's office, however, was of a permanent nature from a central location on the coal pile. From this point lines radiated to the portable pyods.

The pyod receptacles were numbered 1 to 15 on each row, which had a distinguishing letter. The switches in the engineer's office were numbered and lettered in a manner to correspond with the pyod receptacles. This plan permitted an attendant to place the pyods in the desired receptacles, and the engineer to observe and record in the station log, in numerical order, the temperature readings of the coal at the different points. After placing the last of the pyods in row "A," the attendant immediately commenced transferring them to row "B" in numerical sequence. The time was considered sufficient for the pyod to adjust itself to the various temperatures encountered, inasmuch as the temperature to be measured already existed in the pockets formed by the pyod receptacles. Thus an unbroken operation can be carried out in the shortest possible period of time. After the temperature existing in the last pyod receptacle was read all the pyods were transferred to centrally located receptacles, as it was assumed that this would be in the vicinity of the greatest possible heat generation, inasmuch as they are the farthest removed from the cooling effect of the air.

CONFERENCE ON LIMIT GAUGES

By H. J.

A conference on the question of limit gauges for general engineering work was held recently by the British Engineering Standards Association at the Institution of Civil Engineers, at which Sir Richard Glazebrook presided. The paramount necessity from a national point of view of a standard system of such gauges for general engineering work has been emphasized by the experience of the war. The immense amount of interchangeable parts required, owing to the abnormal demands made during the war, has brought this question very much into prominence. With the return of peace, it is realized that competition will be very strenuous. Repetition work is absolutely necessary, and if the manufacturers of the country can be persuaded to adopt a system of limit gauging, not only will the character of their work be improved, but their output will be increased. About fifty people were present, chiefly manufacturing engineers.

Two important points were brought out during the discussion; in fact, they were thought by some of those present to strike the keynote of the situation. One laid stress on the necessity for publicity and educational work, and the other emphasized the importance of securing that any system recommended should be a development of and not incompatible with, the systems at present in use in the various factories. This latter point, it was felt, would need careful investigation, there being little definite knowledge as to the number of firms throughout the country using systems which would be affected by a new scheme.

The chairman stated that the conference had been called together to gain some general idea of the views of the manufacturers as to the principles which should, in their opinion, underlie a system of limit gauging for general engineering work; to learn their own experience, and to discover by means of a properly organized investigation into the subject how far they consider it would be possible to co-ordinate existing practices so as to evolve a standard system which could be used satisfactorily by all concerned.

The meeting discussed at length the following points. A general expression of opinion was asked for in each case, not as constituting a definite decision, but rather as affording some indication as to the trend of opinion in regard to the main points at issue: (1) Should the hole or the shaft be taken as the basis. It was agreed that the hole should be the basis; (2) Disposition of limits. Two main proposals were discussed: (1) That the mean dimension of the hole should be its nominal size, the tolerances being both positive and negative; (2) That the minimum dimension of the hole should be the nominal size, the tolerances being positive. Apart from theoretical considerations, the choice of the mean size as the nominal was urged for the reason that as this system was already employed in the principal existing systems, it would be more likely to gain a general adoption than would the other. The voting, however, out of forty-six present, showed twenty-three in favor of taking the minimum hole as standard, as against sixteen in favor of taking the mean.

Qualities of Work

(3) The general feeling was that four or five qualities of work would be sufficient, qualities of work being taken to mean degrees of fineness of tolerance. Some present considered more to be necessary, others thought three sufficient.

Classes of Fit

(4) It was agreed that the following three classes of fit would be needed, i.e., running fits, transition fits, and interference fits. It was emphasized, however, that it would not be necessary to arrange for all the qualities of work in each class of fit.

Allowances

(5) The question as to whether the basis of the system should be the minimum or mean allowance in the case both of running and obstruction fits received considerable attention, and was left for more detailed consideration. As regards the basis for laying down tolerances and allowances for running and transition fits, it was agreed that further experimental work was needed before this could be finally settled, but the feeling was expressed that the formula:

$$\text{Allowance} = a + b\sqrt{D},$$

a and b being suitable constants and D the diameter, might be accepted provisionally. In applying such a law the tolerance would naturally increase by a series of steps, its amount being constant over a given range of diameter and increasing by some definite step at the end of the range. It was generally agreed that for most qualities of work the steps should be limited to multiples of two or four ten-thousandths of an inch, while not excluding multiples of one ten-thousandth in the finer qualities of work, and the ranges formed by the series .1, .2. .3, .4, for an inch were thought to be suitable for running and transition fits. It was thought that interference or obstruction fits should increase proportionally to the diameter.

Procedure

(6) The question has hitherto been considered by a sub-committee of the sectional committee on machine parts, their gauging and nomenclature, and at the close of the conference the meeting was asked as to whether it considered it would be desirable for a larger and more representative committee to be formed for the sub-committee to report to in order to obtain the widest publicity possible for the work and the fullest measure of support for the recommendations when issued. It was agreed that such a course would be beneficial as safeguarding all interests, and a scheme by which, pending the formation of this sectional committee, the present sub-committee should be reorganized with the addition of a number of manufacturing engineers, and given the power to appoint panel or small committees of experts to commence the detailed work, has now been sanctioned by the main committee of the association, and is being put into operation.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

TRADE GOSSIP

The J. C. Wilson Mfg. Co., Ltd., Belleville, Ont, is in the market for a 6 to 8-ft. vertical boring mill.

Brickmaking in Manchuria.—In Kaiuan, Manchuria, a company has recently been organized with a capital of $50,000, to manufacture bricks.

Substation Expands.—The Toronto Hydro-Electric Commission has purchased the property at 27 and 29 Nelson Street, for the purpose of extending the substation at Duncan Street.

Saw Mill Burns.—The saw mill of Mr. Musclow, situated at Musclow, North Hastings, was completely destroyed by fire recently. The loss is a total one and is not covered by insurance.

New Brantford Shop—The Allied Aeroplanes, Ltd., Brantford, Ont., has been incorporated with a capital stock of $40,000 by John Dowling, Brantford, Ont.; Bryan Dowling and others of Toronto, to manufacture aeroplanes, engines, etc.

To Spend Large Sum.—The expenditure of a sum of $2,500,000 is contemplated by the Beaver Wood Fibre Company in the expansion of the Thorold plant, as well as building a duplicate of the Ottawa plant to take care of the increased Canadian and export business.

The Newmarket Explosion.—The inquest on the victims of the explosion at the factory of Wm. Cane & Sons, Newmarket, has been postponed until July 25th next to allow of the experts making a thorough analysis of the water used in the boilers, which is supposed to have been responsible for the accident.

Increasing Yard Area.—The large farm of A. Weaver, on the Niagara River frontier, nine miles from the International Bridge, has been secured by a party of Toronto realty dealers. It is understood that the ground will be used for extending the yard holdings of the Canadian Niagara Bridge Company.

To be Completed.—By August 1 it is expected that the contractors will be able to hand over the St. John Valley Railway to the Dominion Government, to be operated as part of the Canadian National Railways. Hon. W. F. Jones, president of the St. John & Quebec Railway Company, has made this announcement.

New Machine Shop.—Contracts have been let by the Lang Manufacturing Co., of Guelph, for the erection of a new machine shop to be built on the Harris St. side of their present factory. This is necessary owing to the expansion of their business, which is increasing at a rapid pace. The firm, which conducts a general machine shop business, purpose taking up other lines when they have the new premises available.

Embargo on Freight.—The United States Railroad Administration has issued orders for an embargo on all coastwise freight traffic, due to the congestion caused by the marine strike. Much perishable freight is already piled up at Atlantic and Gulf ports, and the secretary of the Seamen's Union claims that the entire shipping of the country will be tied up within the next two weeks if a settlement is not reached.

Contract Let.—The General Motors of Canada, Ltd., has awarded the general contract for a factory at Oshawa, Ont., to cost $1,000,000 to the Canadian Stewart Co., foot of Cherry street, Toronto. It will consist of an assembling building, four stories, 40 x 80 ft., of reinforced concrete; shipping building, 80 x 200 ft.; storage building, four stories, 80 x 800 ft.; enameling building, 80 x 300 ft., three stories.

New Industry for Miramichi.—Mr. H. W. Mobbs of Kettering, England, president of the largest last company in the United Kingdom, is looking into the prospect of starting a last-making industry on the Miramichi. If they can get the stumpage at reasonable rates they propose to establish mills to handle 3,000,000 feet of lumber. This would be sawn, shaped and seasoned, leaving only the final operations to be done in England. The lumber required is rock maple.

Trade With New Zealand.—Mr. Beddoe, trade commissioner for Canada in New Zealand, who is on a visit here, gave some illuminating figures on the development of trade in the last few years. Since 1900 the exports from Canada to New Zealand have increased from 150,000 pounds sterling to 1,000,000 pounds a year. The exports from New Zealand have grown from 100,000 pounds to over 1,000,000 pounds sterling. Mr. Beddoe is here with the object of familiarizing himself with conditions in Canada after the war.

To Try New Boilers.—In order to try out the Spencer heating boilers equipped with self-feeding furnaces, which have been successful in Hamilton schools, the Board of Education of Toronto departed from their usual rule of accepting the lowest tender. The difference in the bids was as follows: Tubular boilers, $12,300; brickwork, $6,100. Spencer boilers, $15,500; brickwork, $7,375. The installation in Toronto will be in Howard Park School.

Imports Decrease.—Trade returns for the three months ending June 30th, show a great decrease in imports compared to the corresponding three months last year. The total value of imports last year was $250,527,808, while the value for this year was only $200,615,514, the decrease being $49,912,294. Domestic exports for the three months this year were $244,096,793, and for last year $258,673,479, a decrease of $14,576,681. The trade as a whole decreased by $59,108,602, the figures for this year being $455,746,463, and in 1918, $514,746,065.

Beating Great Britain.—The fact of large orders going to Canada and the United States from the South African Government, was the cause of enquiry in the British House of Commons by Mr. R. P. Houston, member for Liverpool. These orders were for 44,000 tons of rails, 1,000 cars, 250 trucks, and 70 locomotives. The Colonial Under Secretary in reply stated that some of the orders had been placed prior to the signing of the armistice, when Great Britain was not in a position to supply railway material. British prices and dates of delivery on the locomotives were unsuitable.

MARINE

Buffalo.—Several of the crews of ships leaving the Great Lakes for European waters are refusing to sign for any further distance than Montreal, owing to the strike of shipworkers on the Atlantic coast.

C.P.R. Ordered to Start.—The Canadian Pacific Railway Co. has been ordered by the Dominion Railway Board to begin the construction of its new terminals at Kingston not later than May 20, 1920.

Montreal.—The "Canadian Volunteer," the first of the Government vessels to make the trip from Vancouver to the United Kingdom, will soon be followed by the "Canadian Trooper." The Wallace Shipyards expect to deliver this vessel about August 7.

Lumber Price Investigation.—The contractors in the district of Calgary have been notified by Premier Sir Robert Borden that their demand for an investigation into the price of lumber will receive his immediate attention. An en-

New Haven, Conn.

Canadian Agents:
Williams & Wilson, Ltd., Montreal; The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg and St. John, N.B.

quiry into the price of linseed oil and paint is also demanded.

Vancouver.—The last of the Lyall ships will have been probably launuched by the 22nd July, and no further vessels are expected to be built in the yards. The total tonnage of wooden vessels constructed amounts to 37,800 tons, some of which is at sea and some still at the fitting out wharves. Six of the ships were for the Imperial Munitions Board.

London.—The Shipping Engineering and Machinery Exhibition that will be open in September will afford the public an opportunity to see the luxury and ease of sea travel. Everything of interest from a marine engineering standpoint will also be on view, and there will be no exhibits of enemy origin in the exhibition.

St. Johns.—High freights offering to Buenos Ayres and other southern points have denuded the market of steamer offerings, but there are plenty of sailing vessels. They are getting from 345 shillings to 350 shillings for transatlantic cargoes per standard. Lumber mills are all busy, with good prospects for future business.

St. Thomas.—Negotiations are going forward between the St. Thomas Board of Trade and representatives of the Cleveland Transportation Company with a view to the resumption of the service between Port Stanley and Cleveland. This was discontinued during the war on account of the restrictions on the higher expenses. It is hoped to start the service at the end of July.

New York.—According to a statement by the American Steamship Association no strike-breakers will be employed to man ships affected by the marine strike, the association stating that they prefer to let the ships remain idle. The strikers say that if an agreement is not speedily reached they will appeal to seamen's labor organizations in Great Britain to take similar action.

Cleveland.—The freight situation is quiet. There is not much grain movement and tonnage is freely offered for ore. Small carriers and line boats are taking all the grain that is offering. Sales have been light in the ore trade but a better buying movement is looked for by the end of the month. The movement of coal from the Pittsburgh district is also light and vessels have frequently to call at two ports to make their full cargo.

New Westminster.—The Poplar Island Shipyard of the New Westminster Construction Company has been permanently closed down as far as the company is concerned. The company are outfitting the remaining French vessels, but they have no more building contracts in sight, and they are selling out all their equipment. The opinion of Mr. H. M. Fullerton, the secretary-treasurer of the company, is that the wooden shipbuilding business is done.

Chair Works Changes Hands. — The Canada Last Co., of Toronto, has purchased the works of the Preston Chair Co. from the corporation of Galt. The company went into liquidation, owing the municipality the sum of $19,153, and the price paid the corporation by the Canada Last Co. was $21,000, which clears the town of any loss. The new owners will spend a considerable sum in improving the property, and will employ from 40 to 50 hands.

Ashtabula.—The coal steamer, "Dundurn" was lost by foundering near the breakwater at Ashtabula, Ohio, in a heavy storm. The "Dundurn," which was owned by the Canada Steamship Lines, was 186 feet long by 30 feet beam, and 12 feet deep, and was well known on the lakes. She was on the Hamilton to Montreal trade under the late Capt. Cooney for some years. Two of the crew were drowned when the vessel went under.

Boston—The steamer "Governor Cobb," Boston to Yarmouth, N.S., went aground on Green Island in a thick fog. She had 500 passengers aboard. She floated on the flood tide and proceeded to Yarmouth under her own steam. Green Island is three miles east, nine degrees north of Gannet Rock, and nine miles due south of Yarmouth, and is a small rock about 50 feet high. It is surrounded by detached rocks, and on the south side ledges stretch out to sea for about half a mile. The remaining shores of the island are very steep.

Canadian War Inventions.—There is a department at Argyll House, London, which has been instituted to deal with Canadian war inventions. A large number of devices have been submitted, of which a fair proportion were found to be of practical utility. Chief among these may be mentioned the following: Improvement to gas masks, of which about three million were manufactured, by Lieut C. Rosling, C.E.; Lewis magazine loader and improvements to Colt machine gun, invented by Major H. R. Northover, M.C.O.B.E., both of which were used. and a bomb dropper invented by Lieut. Col. W. F. Kemp, D.S.O. The inventions cover appliances all the way from a combination turf cutter and conveyer to an auxiliary field kitchen.

PERSONAL

Mr. W. B. Roberts, who has just returend from England where he held the rank of Lieut. Commander (Engr.) in the Royal Navy, has been appointed chief inspector for Saskatchewan and Alberta, for the General Accident Insurance Co., boiler department. Mr. Roberts, before going overseas, represented the company in that territory for about two years. He was connected with the Manchester Steam Users' Association for a period of five years, where his opportunities to obtain expert knowledge of boiler questions was unlimited. Besides his naval experience, he was in the mercantile marine for some years, and holds the extra first-class certificate of the British B. of T. He should be a great acquisition to the engineering fraternity of the prairie provinces.

INCORPORATIONS

The Chas. H. Russel Co., Ltd., has been incorporated with a capital stock of $20,000. divided into 200 shares of $100 each, with head offices at Montreal, to carry on a general lumber business.

The Maritime Paper Co., Ltd., with head offices in Moncton, N.B., has been incorporated to carry on a general paper manufacturing business. The capital stock will be $100,000, divided into 1,000 shares of $100 each.

Hugh Doheny & Co., Ltd., have been incorporated with a capital stock of $2,000,000, divided into 20,000 shares of $100 each, and head offices in Montreal, to carry on the business of general contractors and engineers.

The United Portland Cement Co., Ltd., has been incorporated with head offices at the town of Brantford, to manufacture and sell Portland Cement. The stock of the company is $200,000, divided into 2,000 shares of $100 each.

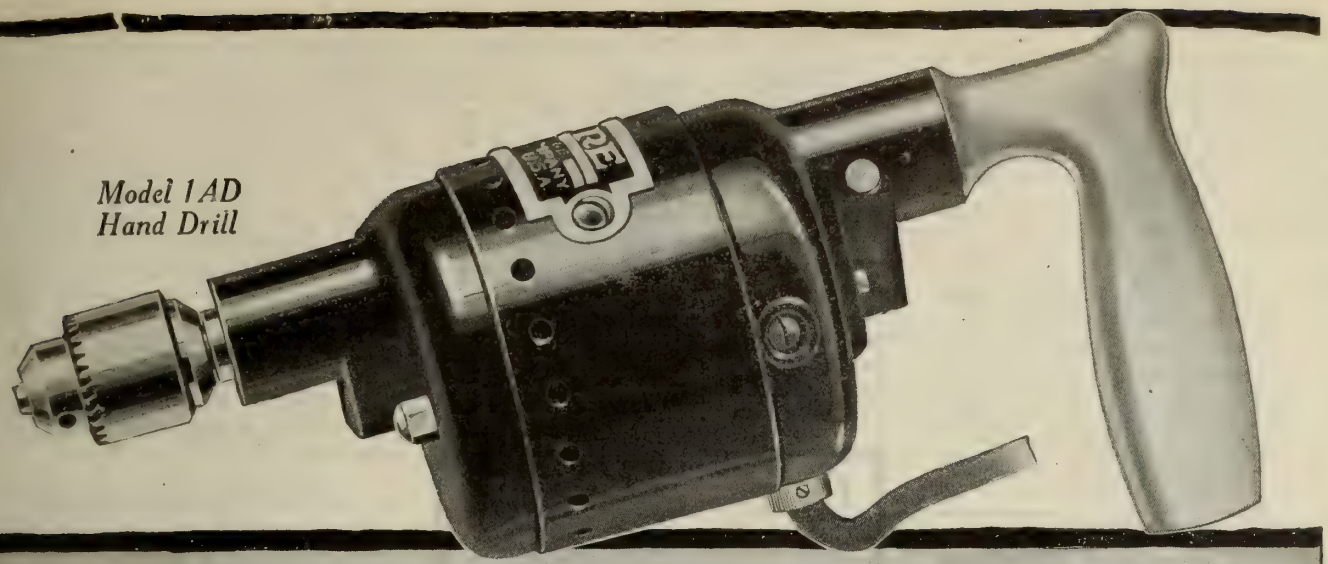
The Chase Tractors Corporation, Ltd., has been organized with a capital of $2,000,000, divided into 20,000 shares of $100 each, with head offices in Toronto, to carry on the business of steel founders, mechanical engineers and general manufacturers.

H. Corke & Co., Ltd., have been incorporated with a capital stock of $100,000, divided into 400 shares of $25 each, to carry on the business now carried on by H. Corke & Co., Georgetown, manufacturing woollens and cottons.

The Battery Engineering and Supply Co., Ltd., with head offices in Ottawa, has been incorporated with a capital stock of $50,000, divided into 500 shares of $100 each. The company will manufacture all kinds of electrical appliances and automobile engines.

The Continental Storage Battery Co., Ltd., has been incorporated with a capital stock of $50,000, divided into 500 shares of $100 each, the head office being in Ottawa. The object of the company will be to make and sell batteries, and deal in automobiles and supplies generally.

The International Coal and Coke Co. has been incorporated with a capital stock of $3,000,000. divided into three million shares of $1 each, with headquarters in Coleman, Alta. The company will do a general business in coal



Model 1AD Hand Drill

MODEL 1AD Hand Drill

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, brass, aluminum and alloys, 0 to $\frac{3}{16}$ inches.

Motor—Universal, operates on either direct or alternating current. Diameter of motor 3⅜ inches.

Spindle—Offset from center $\frac{25}{32}$ inches.

Drive—Helical gears.

Handle—Aluminum. Complete with 10 foot cord, plug, switch and chuck. Jacobs chucks used as regular equipment.

MODEL 2AD Sensitive Drill

Height—18 ins. **Weight** 18 lbs.

Stroke—3¼ ins. **Feed**—Rack and pinion. Helical gear drive.

Capacity—Steel, brass aluminum and alloys, 0 to $\frac{3}{16}$ inch. Drills to center of 7½ inch piece.

Motor—Universal, operates on either direct or alternating current. **Diameter**—3⅜ inches.

Spindle—Offset from center $\frac{25}{32}$ inches.

Thrust—Ball bearing.

Table—Adjustable, may be raised, lowered or swung entirely out of the way. Complete with 10 foot cord, plug, switch and chuck. Jacobs chucks used as regular equipment.

and oil lands, coal, coke and oil, and general mining operations.

The Automatic Gauge and Supply Co., Ltd., has been incorporated with a capital stock of $100,000, divided into 1,000 shares of $100 each, with head offices in Montreal, the object of the company being to carry on a general automobile business, and especially to exploit a patent gasoline indicator.

WAGES OF SHEET AND TIN MILL WORKERS REDUCED

Youngstown, Ohio.—Sheet and tin mill operatives will sustain another wage reduction during July and August as a result of the bi-monthly examination of selected sales sheets in this city July 12. The average price of Nos. 26, 27 and 28 gage black sheets shipped by the mills in May and June was found to be $4.35 per 100 lb. This will effect a reduction of 4½ per cent. in the wages of sheet mill hands, as compared with the rate in May and June. At the May settlement the average price of black sheets of 26, 27 and 28 gage was $4.50, and the latest examination discloses therefore a reduction of 15c per 100 lb.

The average price on shipments of tin plate per base box during May and June was $6.90, as against $7.15 for March and April. This reduction of 25c per base box means a reduction of five per cent., for tin mill workers. During the Atlantic City conference to establish an annual wage scale, which fixes a basis for the bi-monthly settlements, the sheet mill crew, except the roller, heater, rougher and shearsman, received an advance on the base rate of from 5 to 10 per cent. The reduction of 4½ per cent. is therefore a full loss for the higher paid men and takes away for the two-month period about half the increase granted those lower paid.

This is the third wage cut this year in both sheet and tin divisions, the first one coming at the March settlement, when sheet operatives were cut 10½ per cent. and tin mill hands 8 per cent. At that time, the settlement was based on an average selling price of $4.90 for sheets and $7.45 for tin plate.

FURNACES INSTALLED

The Electric Furnace Co., of Alliance, Ohio, has just installed a battery of two Baily Electric Furnaces at the Capital Brass Works, Detroit, Mich. These furnaces are the standard 105 k.w. tilting type, with hearth capacities of 1,500 pounds each. They will be used for melting yellow brass scrap and borings in the foundry.

The Buick Motor Co., Flint, Mich., has just purchased a second Baily Electric Furnace for melting phosphor bronze. The furnace is of the tilting type, rated at 1,500 pounds hearth capacity, and an electrical capacity of 105 k.w.

The Akron Bronze and Aluminum Co., Akron, Ohio, has installed a 50 k.w. rectangular tilting type Baily Electric Furnace in its jobbing foundry. This furnace has a hearth capacity of 300 to 500 pounds and will be used for a wide variety of compositions. Heats will range from 100 to 500 pounds, and will include gun metal, phosphor bronze, red and yellow brass.

Surplus In United States Has Been Disposed of In Short Order

The U. S. Government surplus of copper, which producers agreed to market within 15 months, has all been sold, only three months being required to accomplish the task. Originally placed at 140,000,000 pounds, the Government holdings were actually less than 100,000,000 pounds and practically every one of the leading producers took a proportionate part to work in with his own sales.

May Purchase Towers.—It is reported that the Nova Scotia Steel and Coal Company have started negotiations for the purchase of the coaling towers at the Halifax terminals, now the property of the British Ministry of Shipping, and also for the purchase of a large supply of coal now on the piers.

New Quarters.—The International Machinery and Supply Company have acquired a four storey building at 421 St. James Street, Montreal, and in a short time will remove from their present office. The new building will have a floor space of about 7,000 square feet, and in addition to their present activities the firm will start an electrical department. R. J. Hiller will be the manager of the new department.

TO ENLARGE STEEL PLANT

It has been decided by the Lake Superior Corporation to begin work immediately on an extension of the rail mill of the Algoma Steel Co.'s plant at Sault Ste. Marie, Ont.

The purpose of the extension is to make possible the production of structural steel up to 23 inches. Work will be begun at once, and the extension will cost several hundred thousand dollars. It is exected to be completed by November. It has been stated that this is but the first step in a considerable development of the plant, with a view to further caring for the Canadian market for this form of steel product, and that the ultimate scheme will be on a large scale. The present extension is not made with any understanding with the Dominion Government, but is said to be based on the expectations of the market for Canadian produced steel, which is expected to extend on a large scale. The rail mill of the Algoma Steel Co. is now running at about 46 per cent. capacity, and the other portions of the steel plant are going at about full capacity.

Open Toronto Office.—An uptown office was opened recently in 303 Royal Bank building, Toronto, by the Cataract Refining Co., of Buffalo. The warehouse of the company is on the Don esplanade. Mr. F. M. Deer is in charge of the new office, and plans are being made to still more thoroughly cover the Canadian market by the company's representatives.

Grant for Smelter.—A delegation waited on Premier Oliver of British Columbia with a request for a loan of $300,000 for the purpose of establishing a Rotherd electric smelting plant in the province. The deputation was headed by Mayor Vance, of North Vancouver, and Reeve Fletcher, of Point Grey. Samples of steel were shown to the Ministers, and they were informed that the high grade exhibits had been made from the ore in the space of four hours. The delegation were promised that a full investigation would be made into the project by the Minister of Mines.

ENGINEERING

Sold Equipment.—The Beaver Engineering Company of Montreal have disposed of nearly all their equipment and will shortly be out of business.

Montreal.—Further developments of the water powers of the St. Maurice River is being considered by the St. Maurice Paper Company. It is understood that the company has leased two sites on the river known as Les Forges and La Gabelle, and it is intended to combine these two, which will give a head of 33 feet, and increase the power now available about 40,000 horsepower.

Extensive preparations are now under way for the Jacques Cartier centennial to be held next month in Montreal. This celebration will last for eight days, from August 9th to the 17th inclusive. An industrial fair will be held in connection with the event and to this end exhibition stalls are now being erected on Fletcher's Field, where the main festivities will take place. It is anticipated that the Prince of Wales will unveil the monument during his visit to the city.

"Yes, They May Be Good, But What Do They Save Me?"

Answer:—There is no "may be" about it.

CHAPMAN DOUBLE BALL BEARINGS on your line shafting will save from 15% to 40% of your total power cost; 95% less lubrication; absolute freedom from oil drip and hot boxes. No upkeep or attention costs whatever.
That is their record of performance in over 4,000 plants in Canada and the United States.

THEY WILL FIT YOUR PRESENT HANGER FRAMES

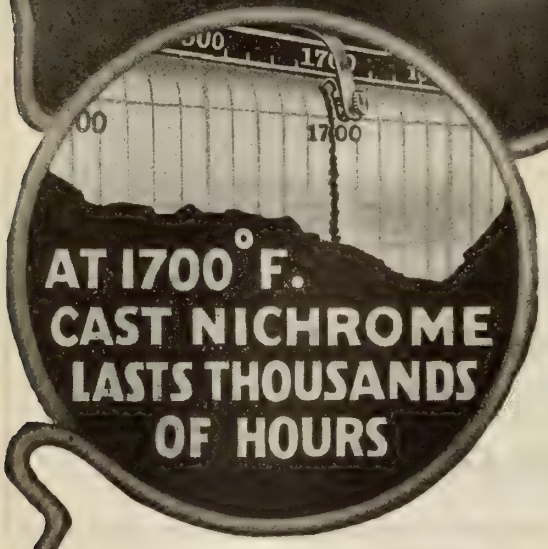
NICHROME
the Casting Durable



AT 1700° F.
CAST NICHROME
LASTS THOUSANDS
OF HOURS

AT 1700° F.
TENSILE STRENGTH
24,500 LB. PER SQ. IN.

Do Your Heat Treating Containers Endure at High Temperatures?

The strength of cast iron at 1100° F. has been shown to be 58% of the normal strength at 70° F.

When repeatedly heated to 1700° F., cast iron cracks, changes in size, and forms a surface scale.

The tensile strength of Cast Nichrome at 1500° F. is 30% greater than the tensile strength of cast iron at 70° F.

Cast Nichrome shows no growth or appreciable change in form as a result of alternate heating or cooling.

Cast Nichrome is exceptionally adapted for annealing and carbonizing boxes, heating retorts of various kinds, cyanide hardening pots, lead tempering pots, etc.

Write for further particulars.

MILWAUKEE MILLING MACHINES

Double Overarm maintains alignment.

It is impossible for the operator to place the arbor supports on the arbor and double overarm in any other way than in line. Arbor cannot be pounded out of line when using large, coarse pitch cutters on rough, heavy work.

Other Distinctive Milwaukee Features:

Solid top knee—hardened steel gearing and shafts in the column and feed box—automatic flooded lubrication—one and one-half gallons of oil per minute pouring over all gears and bearings in the column and feed box, insuring lubrication at all times—flanged spindle with hardened steel collar for driving arbors — constant speed drive, reverse being self-contained.

Send for our No. 21 Catalogue. Illustrating and describing **Milwaukee Milling Machines** and accessories in detail.

KEARNEY & TRECKER CO.

MILWAUKEE, WIS., U.S.A.

Williams' "Agrippa" Cutting-off and Side Tool Holder. A tool which performs both cutting-off and side work by the mere substitution of cutters tells its own story of economy and efficiency.

Williams' "Agrippa" Tool Holders

THE same knowledge of design, experience in the selection of materials and care in the processes of manufacture as have made our *Superior* Drop-Forged Tools *standard* for nearly half a century have been painstakingly embodied in Williams' "Agrippa" Tool Holders. They include all the improvements suggested by experiment with former models. Nothing that will add to their efficiency is spared in their production. Many of their features are unique and make for economy and convenience. A full line in a wide range of sizes is carried in stock for all regular machining operations, including Turning, Planing, Boring, Threading, Knurling, Cutting-off and Side Work.

Booklet of *Superior* Drop-Forged Machinists' Tools describing these and other Standard lines on request.

CODES A. B. C. LIEBER A. 1.

Have The Maritimes Had Fair Play?

THE Maritime Provinces did not enter Confederation very willingly and it may surprise people in other parts of the Dominion to learn that at the present time the people of New Brunswick and Nova Scotia are not altogether pleased with the results of the bargain. There is a distinct feeling among them that the advantages of Confederation have gone to the other Provinces. In the course of an article in the July issue of MACLEAN'S MAGAZINE, Thomas M. Fraser explains why this feeling has grown and the basis for it.

This article was written for the purpose of letting the other provinces know that the feeling exists but it will be of intense interest to people in the Maritimes. Be sure to read it—"The Spirit of the Maritimes."

"The Land of National Leaders"

An article on the political aspect of the Eastern Provinces and the achievements of their leading statesmen.

"Guarding Our Coast Line"

An extremely interesting description of the measures that were taken to patrol and guard the Atlantic seaboard during the war.

Bonar Law, the man from the Maritimes, who has been the able lieutenant of Lloyd George at all crises in Great Britain, appears on the cover in a handsome three-color reproduction.

Other Big Features of the Number

"With the Snowball Brigade"

By Captain Louis Keene

Just back from Siberia—Captain Keene tells some sensational and intensely gripping things about conditions in that country which the Canadian forces are helping to stabilize. It is a record of international complications, strange atrocities and almost unbelievable living conditions.

"The Three Tommies"

By Robert W. Service

A war poem of unusual strength.

"Solving the Problem of the Arctic"

By Vilhjalmur Stefansson

The fourth instalment of his remarkable story of the five years he spent in the north for the Canadian Government, appearing exclusively in MACLEAN'S.

Three Magnificent Stories

The best fiction obtainable is found in this issue: "Owners Up," a race horse story by W. A. Fraser; "His Majesty's Well Beloved," by Baroness Orczy; "Bunkered," by Allen C. Shore.

The Review of Reviews

Here are a few of the articles in this splendid department chosen as the best published during the past month in all magazines:

- Finding Husbands For Three Million Women.
- Will England Become an Agricultural Country?
- Germany Can be Prosperous Under the Peace Terms.
- The Woman Who Wrecked the World.
- The Great Lama Rides in Motor Car.
- Strange Personalities at Paris.
- Making All Men Equal.
- Winning the Secrets of the Desert.

MAXIMUM EFFICIENCY IN BELT LACING

A broken belt won't hold up production long if you repair it with

Patent Steel BRISTOL'S Belt Lacing

Pronounced the most efficient, because it is the easiest, the quickest and the best to apply.
No special tool is required. Simply a hammer and a soft block of wood to drive the sharp, staggered steel prongs through the belt in double rows and to clinch the points. The belt is gripped firmly without danger of cutting or weakening.

Send for samples and Catalog 1-707.

The Most Profitable Machine

is the one which is most constantly in use and capable of handling the widest variety of work.
This is where

BROWN & SHARPE PLAIN GRINDING MACHINES

have proven their worthiness in the big shops in Canada.
Let us tell you facts. Send for the catalog.

BROWN & SHARPE MFG. COMPANY
PROVIDENCE, R.I., U.S.A

Canadian Agents:
CANADIAN FAIRBANKS-MORSE COMPANY, LIMITED
Toronto Montreal Winnipeg Calgary Vancouver St. John Saskatoon

Accuracy Is A Quality

Production Is An Essential

Brown & Sharpe Grinding Machines

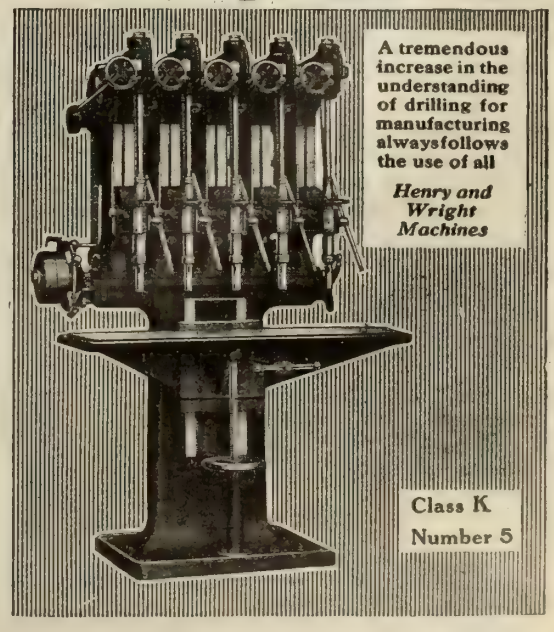
give the perfect combination
Accurate—Production

WE BUILD THEM BY HUNDREDS

Standardized Production enables us to offer this powerful Waterbury Grinder at such a low price. It grinds rapidly and accurately, all flat surfaces, dies, punches, planer, lathe, and other tools. Has adjustable table and tool rest with large radius of travel. Rigid, 3-point table supports giving great steadiness. A reliable, practical grinding outfit.

The Blake & Johnson Co., Waterbury, Conn.

HENRY & WRIGHT
Drilling Machines



A tremendous increase in the understanding of drilling for manufacturing always follows the use of all *Henry and Wright Machines*

"HISCO" Steel Castings

TO ANY SPECIFICATION

The production of dependable steel castings for whatever purpose required demands the most modern equipment.

The Hisco plant can meet any requirement as to weight. Nor is it limited in the matter of alloy or process that may be demanded.

Laboratory tests are applied in our own laboratory to every heat of steel poured.

The plant is equipped with its own electrical furnaces for the production of pig iron.

The pattern department can take care of any specification or blue print for anything to be cast in steel.

Hisco products have a finish that indicates superior workmanship from the first to last operation.

MACHINE MOULDED GEARS

Any size up to 18 feet, without patterns

HULL IRON & STEEL FOUNDRIES, LTD.

HULL, CANADA

Production of Rare Quality at Lowest Labor Costs

There is unusual strength, accuracy, speed, convenience and range in

AURORA
Drilling Machines

You can use them to great advantage on any work in your shop that's suitable for a machine tool of this kind. The operating is easy and the labor cost comparatively low.

Drop a line for full particulars and specifications.
Stationary Head Sizes 20"—21"
Sliding Head Sizes 22"—44"

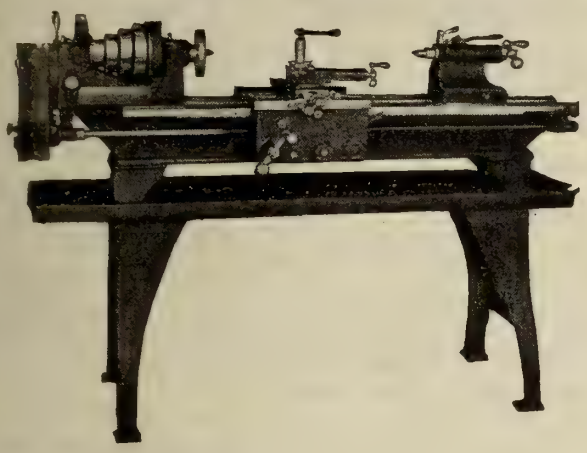
With saving in floor space goes saving in first cost for the "Star" Lathe is *moderate in price.*



Remember, "Star" Lathes are not big lathes. They require little power. This saving has been as much as 40 per cent. in many cases.

"STAR" LATHES

Accurate, Rigid Economical

Users of "Star" Lathes find a large gain from their operating simplicity. Inexperienced help quickly learn to operate "Star" Lathes. Do you realize the saving this means with the scarcity of unskilled labor? 9", 11", 12" and 13" sizes.

The Seneca Falls Mfg. Co. INC.

366 W. Falls St. Seneca Falls, N.Y.

Thor

CHIPPING HAMMERS

Drilling in concrete with a size D hammer with a hexagon nozzle. Will drill a hole one inch in diameter, at the rate of one inch per minute.

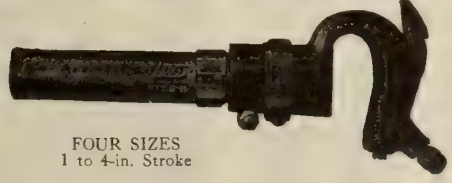
Thor Predominates wherever clippers are used because:

1st. The main valve is large in size and durable, being of the balanced type and having a bearing surface of three square inches.

2nd. Two square inches of the bearing surface retain the lubrication constantly, as no air passes over to blow the oil off.

3rd. The handle is equipped with a self-seating throttle valve, which eliminates all leaks.

4th. The barrel and all working parts are hardened and ground and the hammer is practically free from vibration.



FOUR SIZES
1 to 4-in. Stroke

Riveting Base Plates with size B hammer. Let our service engineer call at your plant and explain the various uses to which these hammers can be adapted, and how to obtain the best results on your particular work.

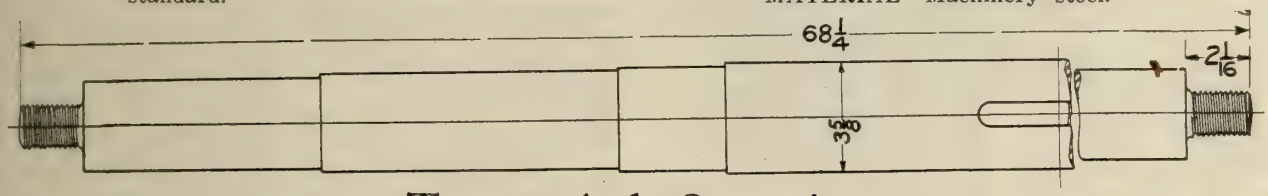
Smalley-General

THREAD MILLING MACHINES

Will give you a short cut to lower-cost thread milling.
Study the blue print and time study as given below.

MACHINE—Smalley-General Thread Miller No. 2.
THREAD—1½ in. diameter, 2 1-16 length, 6 pitch U.S. standard.
PIECE MILLED—Axle for tractor.
MILLING FEED—4.35 per minute.
MATERIAL—Machinery steel.



Tractor Axle Operation

TIME STUDY

5 minutes 37 seconds floor to floor milling both threads. Each thread milled in 65 seconds. Balance of time handling. Barker 3-jaw chuck used which had 12 in. unsupported overhang turn main spindle bearing to thread.

NOTE.—These parts were chucked through the rear end of main spindle. This was an awkward operation because the pieces were larger in the center and the type of chuck would not let them through. A collet chuck with false collets would have permitted faster chucking.

Consult us on every phase of Thread Milling. We will show you how to cut the costs.

Smalley-General Co., Inc., Bay City, Michigan

Canadian Agents: Rudel-Belnap Co., Ltd., Montreal and Toronto

P X H

TRADE MARK

Taking the Guesswork Out of Files

You don't have to take your files any more on trust since P.H. and Imperial Files have been on the market.

Steel and workmanship are the best that can be procured, and performance and wear are guaranteed.

Your money back without question if they fail to stand up.

We know

"They Cut Faster and Wear Longer"

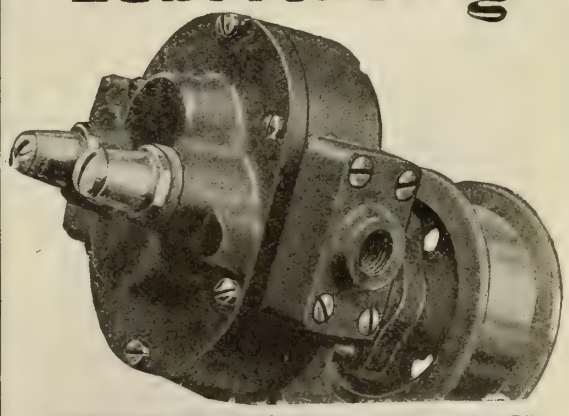
TRAHERN PUMPS

Lubricating



For efficient service and long life. They are built to stand the gaff—hard, continuous use, free from trouble. While running at 500 R.P.M. they will deliver 16½ gals. of coolant per minute or just a drop at will of operator.

Free even flow—no pulsation. Operate in either direction and against pressure.

Write to-day for Cat. 44 and prices.

NAMCO SELF-OPENING DIES

Cut threads rapidly and accurately.

Strong construction of head, correct chasers, positive opening action mean continuous production.

Time saved in threading means increased output of finished pieces.

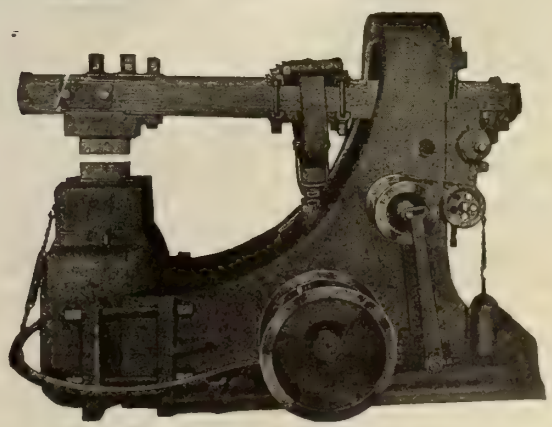
This is Some News:

It takes twenty-six new or twenty-five old and used bills to balance a twenty-dollar gold piece.

25 to 100 lb. heads
6 sizes, 2 styles of frames

NOW, that we have your attention let's think a little about THE ROCHESTER HELVE HAMMER



The Rochester Helve Hammer

Any blow—long or short, fast or slow, heavy or light—any length, weight and force of blow instantly secured on the Rochester "Helve" while the machine is running. This feature alone saves so much time where there is a variety of small work to be forged, swaged or welded, that it recommends the tool without reference to its other distinctive features. Made in 6 sizes, 2 styles of frames; 25-lb. to 100-lb. heads. For Welding and General Forging the "Rochester" is peerless in efficiency. Full description in catalog.

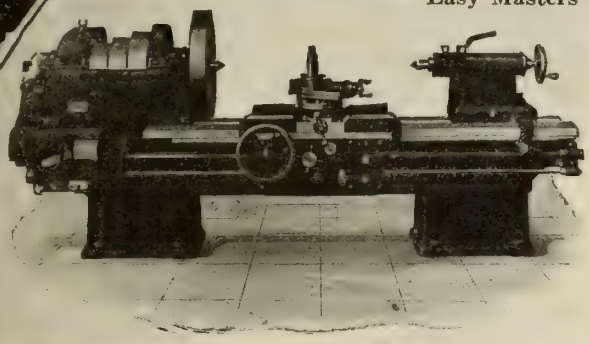
SIDNEY

Heavy Duty Lathes

The 25-inch Heavy Duty Quick Change Sidney shown below is the last word in lathe construction. Every possible improvement will be found in this late model. Bed lengths available are 10, 12, 14, 16, 18 and 20 feet. Also built with a 27-inch swing.

Easy Masters of Big Jobs



Regardless of the severity of work, dependence put on Sidney Lathes has never been misplaced. The Sidney line has made good—with a vengeance. New Bulletin just issued on 25-inch machine. Write to-day!

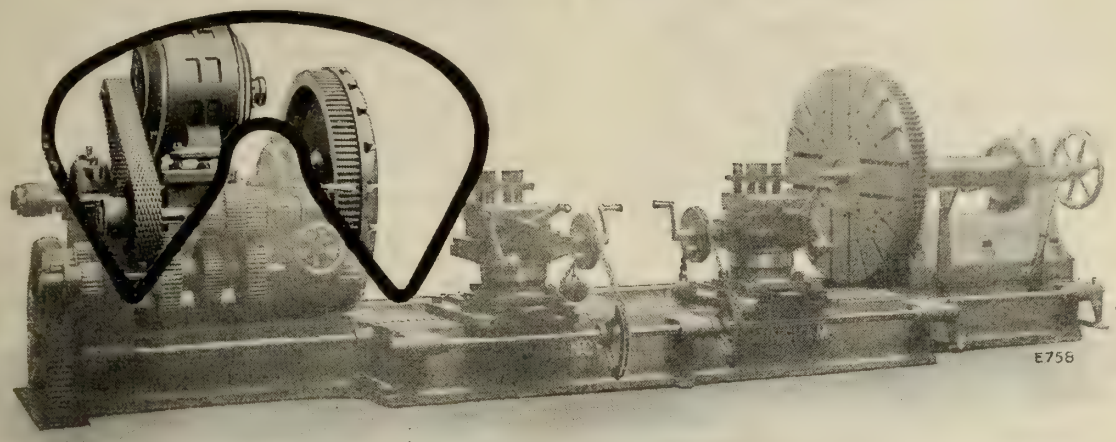
"THE COVENTRY" CHAINS

Have you Considered the Advantages of NOISELESS CHAIN TRANSMISSION?



"The Coventry" Noiseless Chain transmitting Power on a Tangye Lathe built for heavy work.
Note the compact arrangement of the drive.

"THE COVENTRY" CHAIN CO., LTD., COVENTRY, ENGLAND

CANADIAN AGENTS—TAYLOR & ARNOLD, LTD., BANK OF TORONTO BUILDING, MONTREAL

Sixty-four operations with one set-up of the work—

LANDIS

The job referred to is a typical LANDIS achievement—a striking example of the saving of time and labor which is possible with the LANDIS Boring, Milling and Drilling Machines.

The job requires in all sixty-four distinct operations, including boring, milling, drilling and tapping. One set-up of the work—a heavy piece—is all that is required on the LANDIS.

Versatility is a strong feature of the LANDIS. Wherever installed, it is always busy. Ask us for full details on this profitable machine.

Why not learn the full details? Catalog on request.

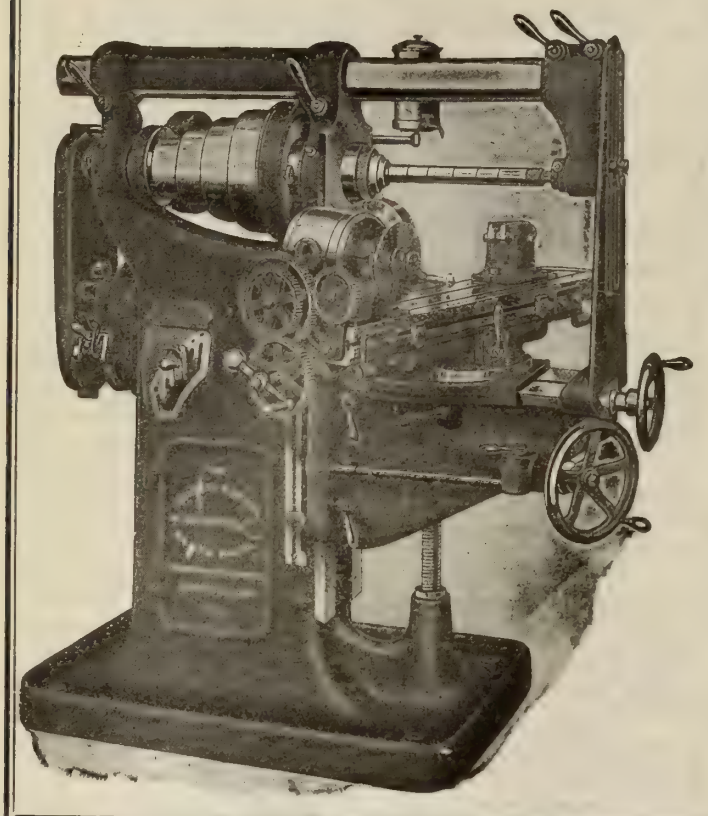
Anybody Can Operate This Miller



and Turn Out a Pile of Work so Simple to Operate is the

"HENDEY"

Skilled mechanics are scarce these days—but anyone can run a machine of its simplicity and turn out work accurately and fast without trouble.

All Feeds positive driven through gearings giving 18 changes.

This is the universal type—designed to handle all milling operations performed on machines of this character, either with regular equipment or by aid of attachments, which can be supplied for increasing efficiency and scope of machine.

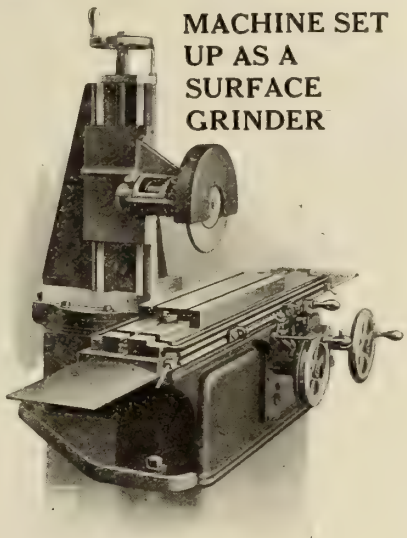
FRASER No. 1 Universal Convertible Grinder

(Patented May 28, 1918)

MACHINE SET UP AS AN INTERNAL GRINDER

MACHINE SET UP AS A SURFACE GRINDER



By the change of heads the machine can be converted into an efficient high-speed internal grinder; also a surface grinder of considerable range

PATENTED APRON CONSTRUCTION. All the springs on this machine are enclosed and can be removed or replaced without disturbing any other part of the machine.

Capacity: Cylindrical work 8 in. x 2 in.
Surface work, 6 in. x 20 in.
and up to 8 in. in height.

May we send you the fullest details?

Some of the Lines we represent:

Tungsten Saw Blades
Moore Bros. Files
Gray Planers
Fraser Grinders
Mueller Radial Drills and Lathes
Sydney Engine Lathes
Cincinnati Electric Drills and Grinders
Elmira Wood Split Pulleys
Standard Bolt Cutters
Racine Machine Saws
McArthur Beltings
Wallace Bench Planer
Kempsmith Milling Machines
Sebastian Lathes
Monarch Lathes
Champion Tools
Silvers Drills
Sweetland Chucks
Smith & Mil's Shapers
And many others.

GAP LATHES

SIZES 18" to 26"

WITH QUICK CHANGE OR PLAIN GEARING

Besides having great range and adaptability have many special features and points of superiority, among which we might mention:

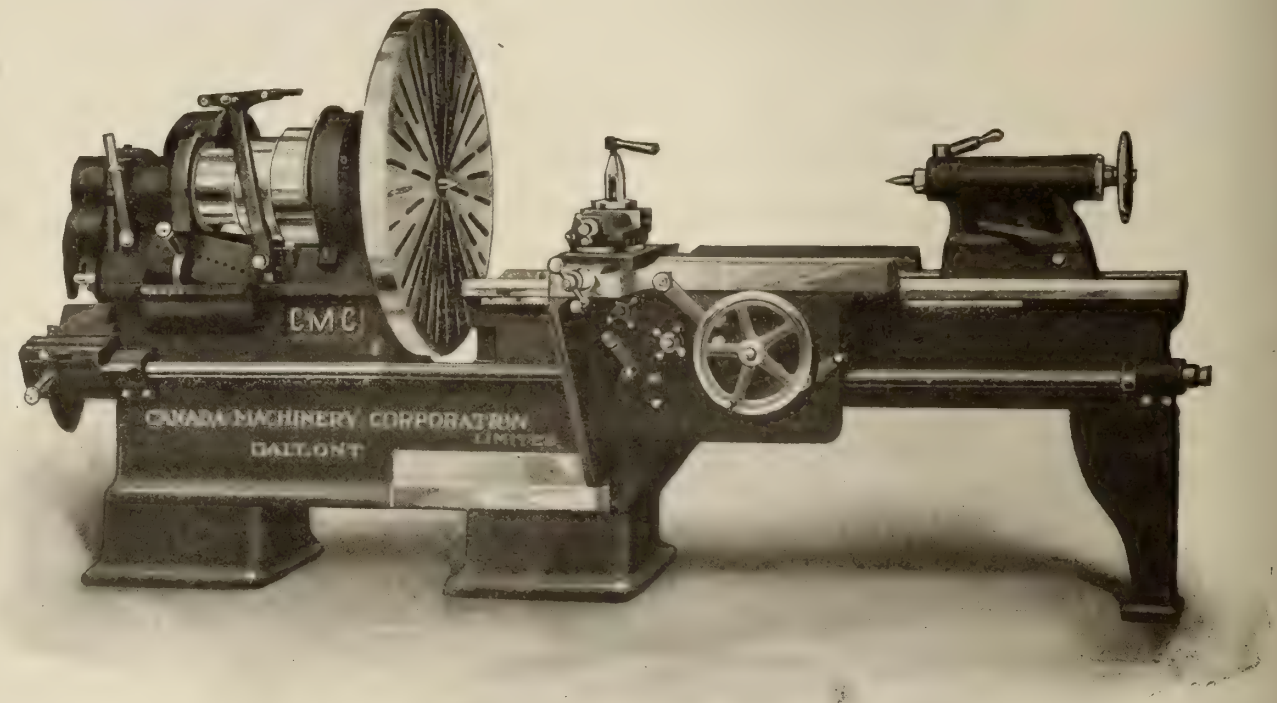
The design of the gap and gap plate is such as to permit the large face plate and narrow work to swing without removal of the plate.

When the plate is removed, jobs of considerable width may be successfully handled.

The bed, especially below the gap, is of unusual weight and strength to insure maximum stiffness under the heaviest cuts.

The headstock is of the three step cone, double back geared type, allowing the use of wide drive belts and giving ample range and number of spindle speeds.

Our improved belt shifter which, besides saving time, forms a safety device, preventing injury to the operator.



18" GAP LATHE WITH QUICK CHANGE GEARS

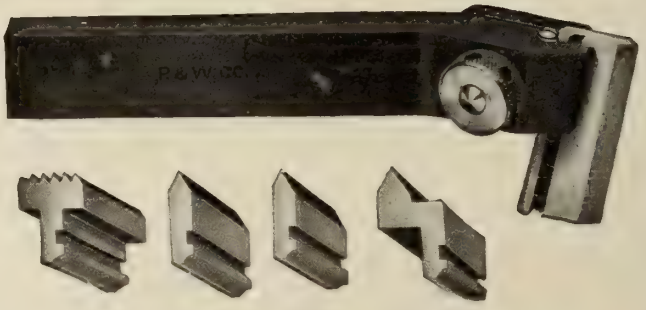
SMALL TOOLS

P. & W. Threading Tools



Chaser | Single Point | Offset | Double Onset

PROMPT SERVICE

is assured at our nearest office. Place your order there to-day.

Uses the same holder for chasers and single point cutters. The change can be made in a jiffy.

A few of its advantages:

- Threads can be cut very close to shoulder.
- Tools are sharpened by simply grinding off top of cutter.
- Combines economy with all features essential in a threading and forming tool.
- Cutters have 15 deg. clearance, which experience has taught gives the longest wear in various metals.

PINK LINE

Logging Tools and Handles

Made-in-Canada products—headquarters for British Empire for all Lumbering Tools.

In every lumber camp in Canada you'll find PINK'S famous lumbering tools. They are the favorites there and have won the esteem of all woodsmen through their superior merit. They are world-renowned and are extensively used in Australia, New Zealand and other countries where the lumbering industry thrives.

EXPORTS TO EUROPE

We ship to Britain and her Allies the same good quality of lumbering tools that have made *Pink's tools* a by-word in the matter of good tools in all Canadian lumber camps. Enquiries cordially solicited.

Purchase the Products of Canadian Mills

TO uphold the Glory we have jointly earned—to honor our noble dead—to comfort the wounded, and extend to the men returned the hand of prosperous welcome, we must cast aside all forebodings and face the future with unbounded courage and confidence and, without a shadow of doubt, declare to the World that this Nation, which was so quickly and successfully transformed to a War basis, can be depended upon to revert to Peace conditions with equal success. The buyer and seller must recognize their duty to the Nation and co-operate fully to the end that all products that can be produced in Canada by Canadian workmen shall not be purchased elsewhere.

OUR Duty is plain; Canada with Canadian labor and capital can produce, manufacture and distribute products sufficient to keep the wheels of industry turning to the limit. The song of Prosperity and Happiness should ring out all over the land. Let us sincerely pledge to the extent of our needs, to purchase materials produced in Canada by Canadian Workmen, and the result of our efforts will return to us the Blessings of a Prosperous and Happy Nation.

Five Betts Planers in this Ohio Plant

BETTS tools are built to render service—not to sell at a price. The Ohio Locomotive Works, in which this photo above was taken, investigated the entire machine tool field before purchasing 5 Betts Planers. After a point for point comparison they found Betts tools to be the best investment.

They have had good reason to congratulate themselves many times on their judgment as the five machines are giving satisfactory service and the production obtained more than meets the rigid requirements of this plant—not only on the class of work shown here, but on every kind of a job that can be handled on a planer.

When you think of machine tools---think of Betts

Betts Machine Company

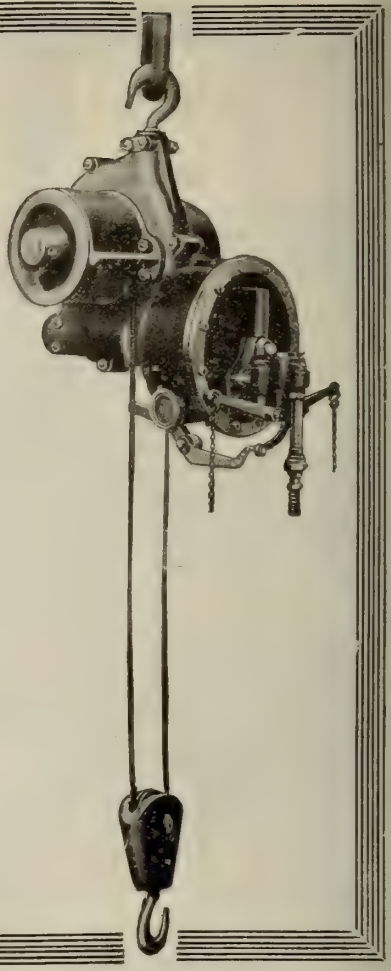
Less Overhead Expense

Whenever a strong, dependable hoist is needed, the "Imperial" air motor hoist fills the bill.



Few Parts Mean Less Trouble
The "Imperial" has few parts

The motor is completely balanced; the sensitive control allows the load to be raised or lowered a fraction of an inch at a time. Ball and roller bearings and thorough lubrication insure long wear.

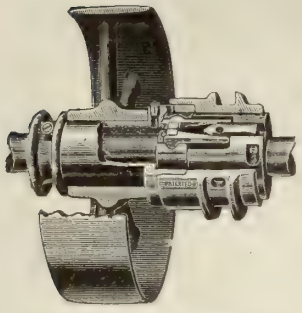
THE JOHNSON FRICTION CLUTCH

A SPECIAL CLUTCH BUILT AS YOU WANT IT



Standard Single Clutch with Pulley Mounted on Hub —Clutch Engaged

To machine builders we offer a service which is exceptional. The Johnson clutch can be made to conform to your own specifications—built into your machine as an integral part, not simply attached. Whatever your requirements are, we can modify our clutch to meet them.

And our continued success in this particular line insures better results than can possibly be obtained by resorting to a makeshift of your own design. The reliability of the Johnson clutch is everywhere recognized.

The leading builders of machines are incorporating clutches which we have designed especially for their use. The quality of service given is indicated by the increasing volume of their orders. We can give you the same satisfaction if you will allow us an opportunity.

Your inquiries are welcome at any time—without obligation to you. Just tell us the conditions, and when our recommendation comes to you, it will bear the stamp of engineering ability.

HIGH SPEED STEEL

INTRA STEEL *GIBRALTAR STEEL*

Tool Steel for Every Purpose

We herewith announce that on and after July 1st, 1919, the firm of

H. BOKER & CO., INC., CANADA,

will be conducted under the name of

PILOT STEEL & TOOL COMPANY, LIMITED,

with head office at the above address in Montreal.

The new company will be operated as a distinctly Canadian corporation, at the same time being closely affiliated with H. Boker & Co., Inc., of New York, representing the latter in Canada.

The Pilot Steel & Tool Co., Ltd., as the Canadian representative of H. Boker & Co., Inc., New York, will act as sole agents in Canada for the entire output of Jonas & Colver, Ltd., Sheffield, England, makers of Novo Superior High Speed Steel, Novo High Speed Steel, Intra Steel, Hot and Cold Rolled Tool Steel, Circular Saws, Planer Knives, Files, etc.

All of the other lines formerly handled by H. Boker & Co., Inc., Canada, such as Gibraltar Steel, Deo Steel, Ico Steel, Music Wire, Resistance Wire, Steel Balls, Nickel Alloys, Twist Drills, Reamers, Milling Cutters, Hack Saw Blades, Small Tools, etc., will be continued to be stocked and supplied by the new company.

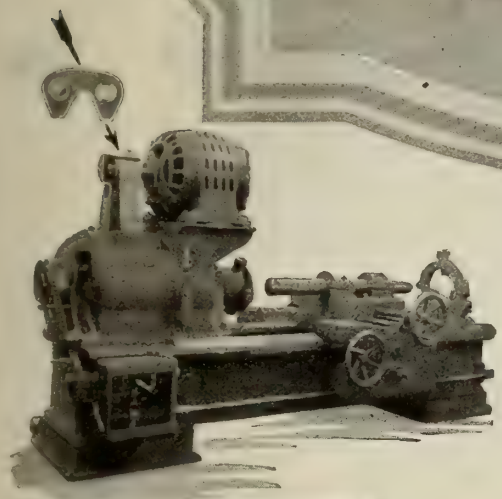
The Directorate of the Pilot Steel & Tool Co., Ltd., will be practically identical with that of the old company.

Mr. F. E. Rejall, who has been Canadian manager for a great number of years, will henceforth act as vice-president and director, and continue the management as heretofore, thus assuring a continuance of reliable and faithful service.

Yours truly,

H. BOKER & CO., INC.

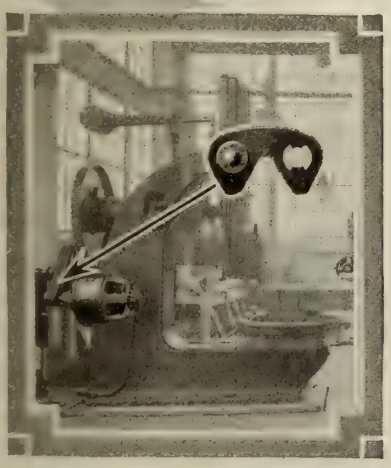
PILOT STEEL & TOOL COMPANY, LIMITED.



Equip Efficient Tools with Efficient Drives

HIGHLY efficient tools are purchased to perform certain operations at a lower cost.

Effective as those machines may be, their maximum efficiency is largely dependent upon the form of drive used.



Link-Belt Silent Chain Drives deliver 98.2% of the power to the driven machine. There's no slippage of belts—no waiting for belt repairs—no inferiority of product due to ununiform application of power.

Every revolution of the motor shaft registers a like revolution of the driven shaft. Speeds are uniform. Greater speed reductions are possible. A better product results.

For Link-Belt Silent Chain Drives are "flexible as a belt—positive as a gear—more efficient than either". Write for our 40-page Machine Tool Drive Book No. 312. Shows many applications and gives full details.

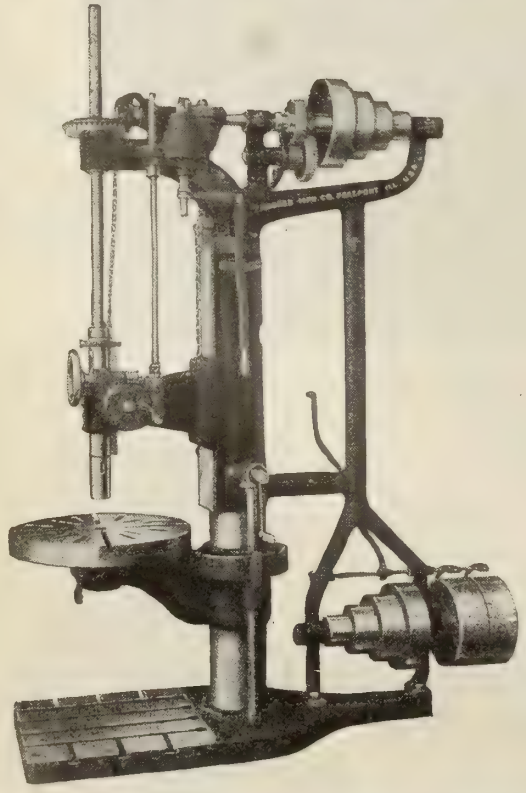
The Driller for Exact Work



HOEFER

Enable Your Workmen to Eliminate Spoilage

The Hoefer Driller is pre-eminently the one to be found in the best plants. "It's almost as good as a Hoefer," so often heard in the machine and tool trade, indicates the position held by Hoefer Drillers.

Exact drilling, to the last thousandth of an inch, pays by eliminating spoiled material. Hoefer Drillers pay for themselves and increase the workman's pride in his work.

Twenty-five Years on Market

Twenty-five years making drillers has given Hoefer the "Know-how." The Hoefer Drillers are used by many of America's leading manufacturers. Equip your factory the Hoefer way. Take any kind of a drilling problem you have to the Hoefer Manufacturing Company, and the Company's experts can tell you how it was solved by other men, some of whom you may know.

Investigate now. Write to-day for catalog. The Hoefer engineers are at your service.

A WALL RADIAL DRILL

That Puts Dollars in Your Pockets

Here's a real machine tool in the wall radial drilling line for your consideration. Listen to this—the machine is made of high grade materials throughout, and the workmanship is beyond criticism. It is designed with the particular idea of maximum production, at a minimum operating expense. Entire control within easy reach makes the operators "boosters" for these machines. You can keep the dollars that may be slipping away on your wall radial drilling propositions, in your pocket by the installation of this machine.

Send for Detailed Bulletin

MADE IN FOUR STANDARD SIZES.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25%; a different method of molding them might double your production at no increase in molding cost. **We can advise you** and we have expert metal and wood pattern-makers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.
We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us.

MODERN TOOLS

MAKE BUSINESS HUM

The Modern Line supplies indispensable aid in business progress. Modern Tools are precision tools of the finest quality, noted for accuracy, dependability, volume of output and durability. We make:

—Modern Plain Grinders
10 sizes—8″ x 18″ to 16″ x 60″.

—Modern Internal Grinders
One model with fixtures in 3 sizes.

—Modern Universal Grinders
Normal range 13″ to 40″.

—Modern Chaser Grinders
For any chasers with parallel sides and general tool room work.

—Modern Self-Opening Die Heads
18 sizes—for threads up to 7 inches.

—Modern "Magic" Chucks
For quick change of tools on live spindle machine.

—Modern Collapsible Taps
3 sizes—Will tap holes ¾″ to 3″.

—Modern Tapping Attachments
For driving tools "through" or "to bottom."

All are tools of widespread use in the States—all have enviable records for reducing costs and speeding up production.

Send for technical bulletin of any which may interest you.

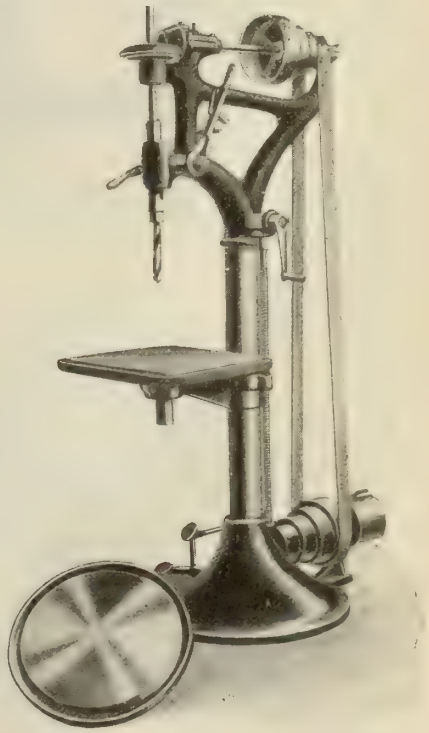
Net weight, 190 lbs.

Perfect No. 14 Drill

A high class drilling Machine. Speed 2,000 R.P.M., drills from 0 to ½″.

Looks Right
Acts Right
because it's built right.



Perfect No. 19 Drill

Geared 2 to 1 and is driven by a 2″ flat belt. It has lots of power, handles a drill from 0 to 29 32.

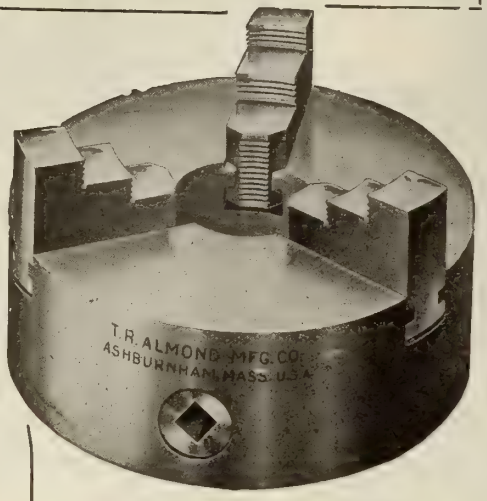
This is a good tool, you don't realize it until you compare it with other 18″ or 20″ drills.

PERFECTLY BUILT BY EXPERT WORKMEN.
WE GUARANTEE EVERY TOOL WE MAKE.

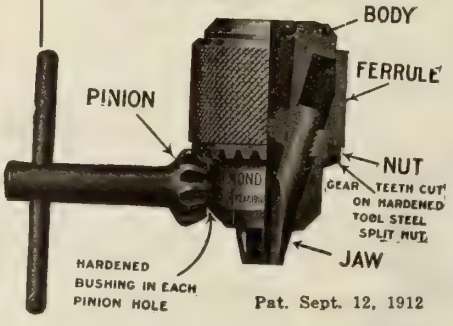
Perfect Machine Company, Galt, Ont.

ALMOND
CHUCKS & MICROMETERS

Give them a try out. Universal Geared Scroll Chuck—Sizes 5″, 6″, 7½″, 9″ and 12″.



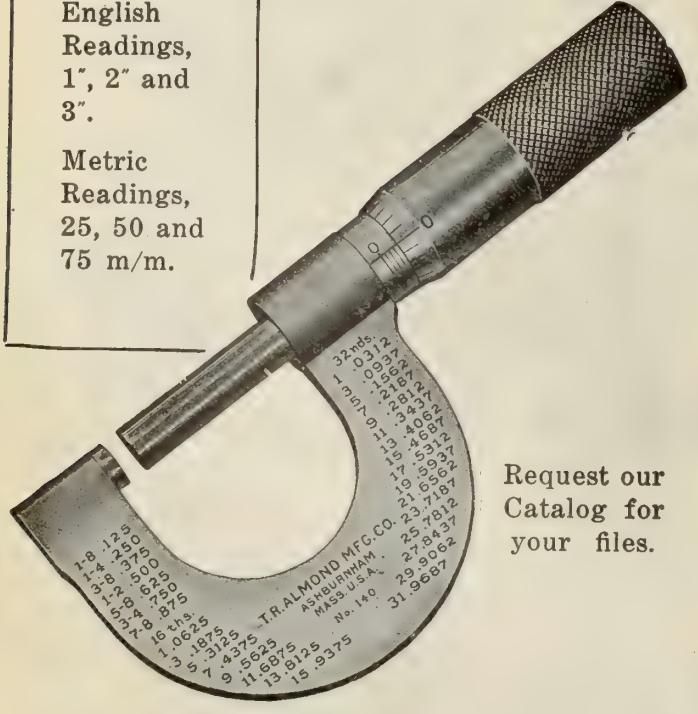
Geared Nut Drill Chucks, in various capacities, 0″ to 1″.



Micrometer Calipers—

English Readings, 1″, 2″ and 3″.

Metric Readings, 25, 50 and 75 m/m.



Request our Catalog for your files.

T. R. ALMOND MFG. CO.

H & G Die Heads

are of small outside diameter compared with the size of work they do.

The H. & G. illustrated is an automatic, self-opening Die Head designed especially for use on Gridley and National Acme Multiple Spindle Screw Machines and others that use the die in a revolving position. The four sizes of this Head cut up to 9/16″, 1″, 1¼″ and 1½″.

All parts are hardened and ground and interchangeable. In a word—it's an H. & G.

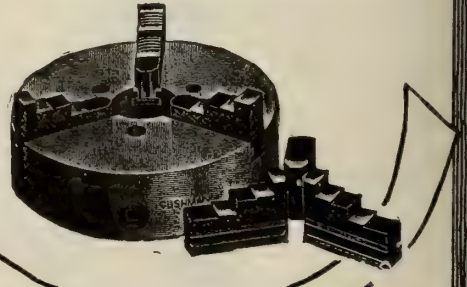
Cushman Chuck Co., Hartford, Conn., U.S.A.



"B-T" Reverse Tapping Attachment

Saves Tap, Time and Trouble

That is what the "B-T" Reverse Tapping Attachment does. It eliminates the necessity of reversing the machine spindle. Simply raising the spindle reverses the tap—the machine, meanwhile, goes ahead at full forward speed.

A reverse speed twice that of the tapping speed is given by an internal gear drive. It is friction driven—automatically adjusted by the amount of pressure the operator puts on the drill spindle. It saves taps, trouble, time and money.

Can also be had with positive drive. Both plain and friction chucks are fitted with jaws to grip round and square end of tap.

Get the details—In our Bulletin.
Write to-day.

BICKNELL - THOMAS CO.

GREENFIELD, MASS., U.S.A.

CANADIAN REPRESENTATIVE - THE JAS. BUCKLEY CO., ST. NICHOLAS BLDG., MONTREAL, P.Q.

Another Broken Tap!

Same old story: tap running at high speed—meets hard spot in metal—strain too much for tap—*snap*—get a new tap. Happens every day unless you use

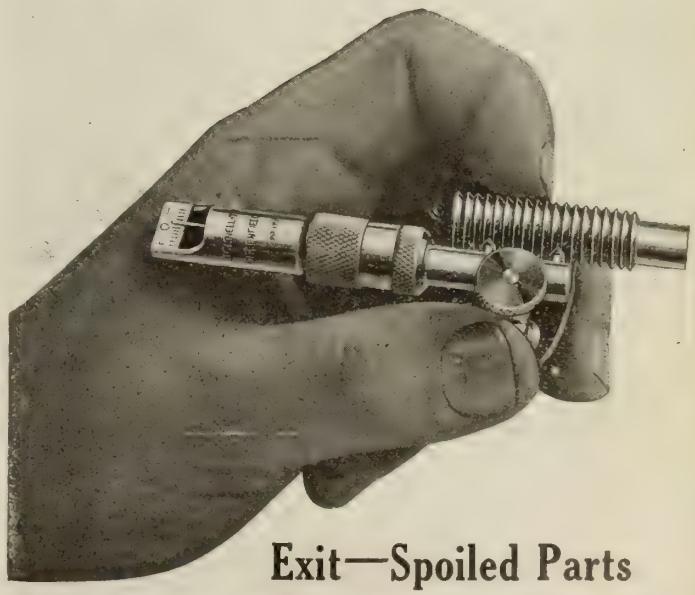
Bicknell-Thomas Friction Chucks

The instant the tap binds with a "B-T" the friction grip holding the tap slips, relieving overstrain, and prevents tap twist or breakage.

Compact; used on multiple-spindle drills and many other machines. Five sizes ⅛"—1"; either straight or Morse Taper Shanks.

How would you like to try one?

B-T THREAD LEAD INDICATOR



Exit—Spoiled Parts

Did you ever have to scrap a threaded part because of incorrect measurement in lead. Were you ever forced, during a rush job, to thread a part over again, because it didn't fit as it should?

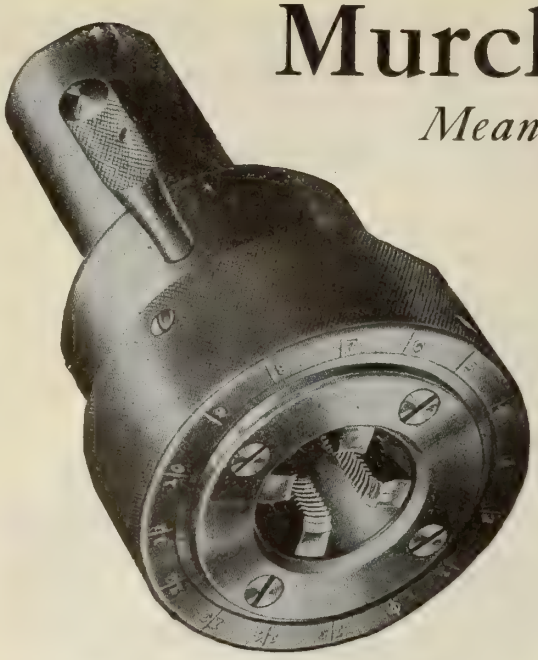
B-T THREAD INDICATORS

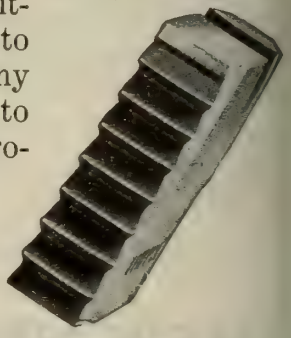
enable you to get the right thread lead instantly and maintain a constant check upon it. They will detect errors of one thousandth of an inch—can be used for testing odd and even pitches, as well as internal and external threads.

SEND FOR OUR BOOKLET.

Murchey Chasers

Mean Quick Deliveries





Murchey Tools will cut your tapping and threading costs. **They will boost production 50%.** Another important feature is Murchey's **Quick Deliveries on Chasers.** This is a Murchey specialty. No waiting! We get your chasers to you when you want them. Why not use Murchey Tools to speed up your threading production?

Send for a Murchey Tap or Die on approval and give it a trial. You will then secure actual proof of its value to you.

Murchey Machine & Tool Company, Detroit, Mich.

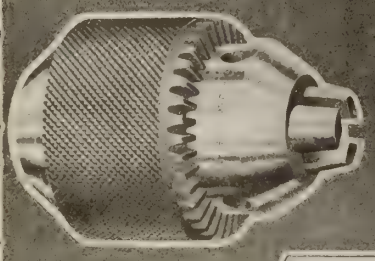
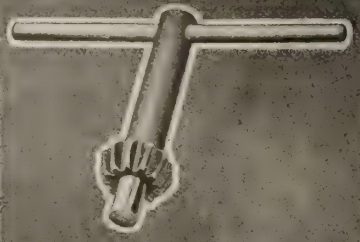
DRILL CHUCK

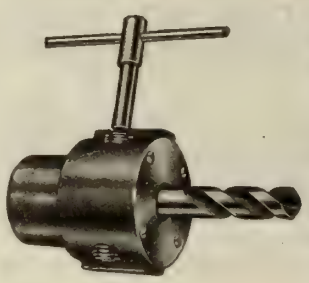


World Famous



The secret of their success is no secret at all, its merely their Superiority

JACOBS MFG. CO
HARTFORD CONN.
U.S.A.



UNION

POSITIVE DRIVE DRILL CHUCKS

The Union Drill Chuck is made in seven sizes (0 to 2 inches) with PATENT TRANSVERSE SLOT—so that drills with tenons can be inserted (see illustration). The shank of drill should be squared on two sides to enter the TRANSVERSE SLOT, giving a positive rotation to the drill independently of the jaws, permitting the jaws to centre and align the drill accurately. The drill is held absolutely true and will not slip under the hardest strain. This type of chuck will be found to give the best results on all classes of work from HIGH SPEED drilling to the hard BLACKSMITH and GENERAL REPAIR work.

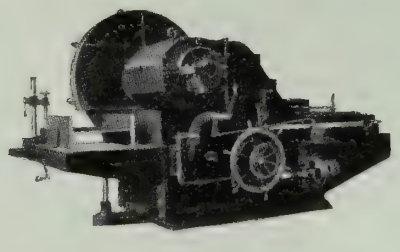
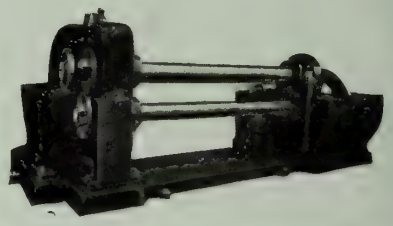
Machine Tools and Metal Working Machiner



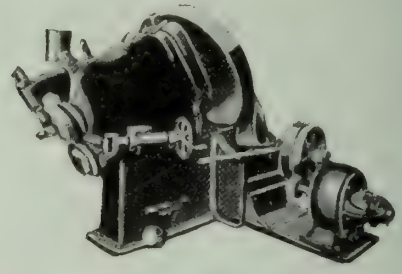
No. 4 High Speed Friction Saw

The Ryerson High Speed Friction Saw is designed for rapid cutting of steel shapes of all kinds. It is made in various sizes with capacity up to largest section rolled.



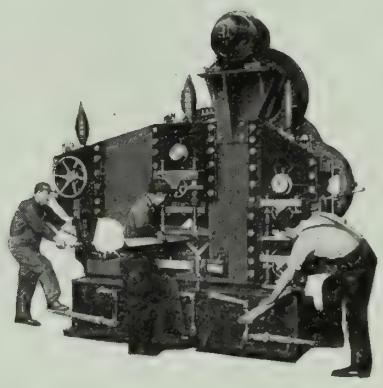
Lennox Double Housing Rotary Splitting Shear

This machine is designed for straight shearing of sheets and plates up to 1½" thick, and will cut through the center of a 20' plate. It will also shear round, square or flat bars.



Lennox Rotary Bevel Shear

This is the most efficient machine now on the market for beveling irregular and curved sheets, boiler heads, flanges, dome sheets, plates, angles, etc. It is made in various sizes up to 1¼" capacity.



Ryerson Quintuple Combination Punching and Shearing Machine

These machines are built in different sizes and in various combinations for punching, plate, bar, angle and beam shearing, notching and coping work. It will handle this work without the necessity of interchanging attachments.

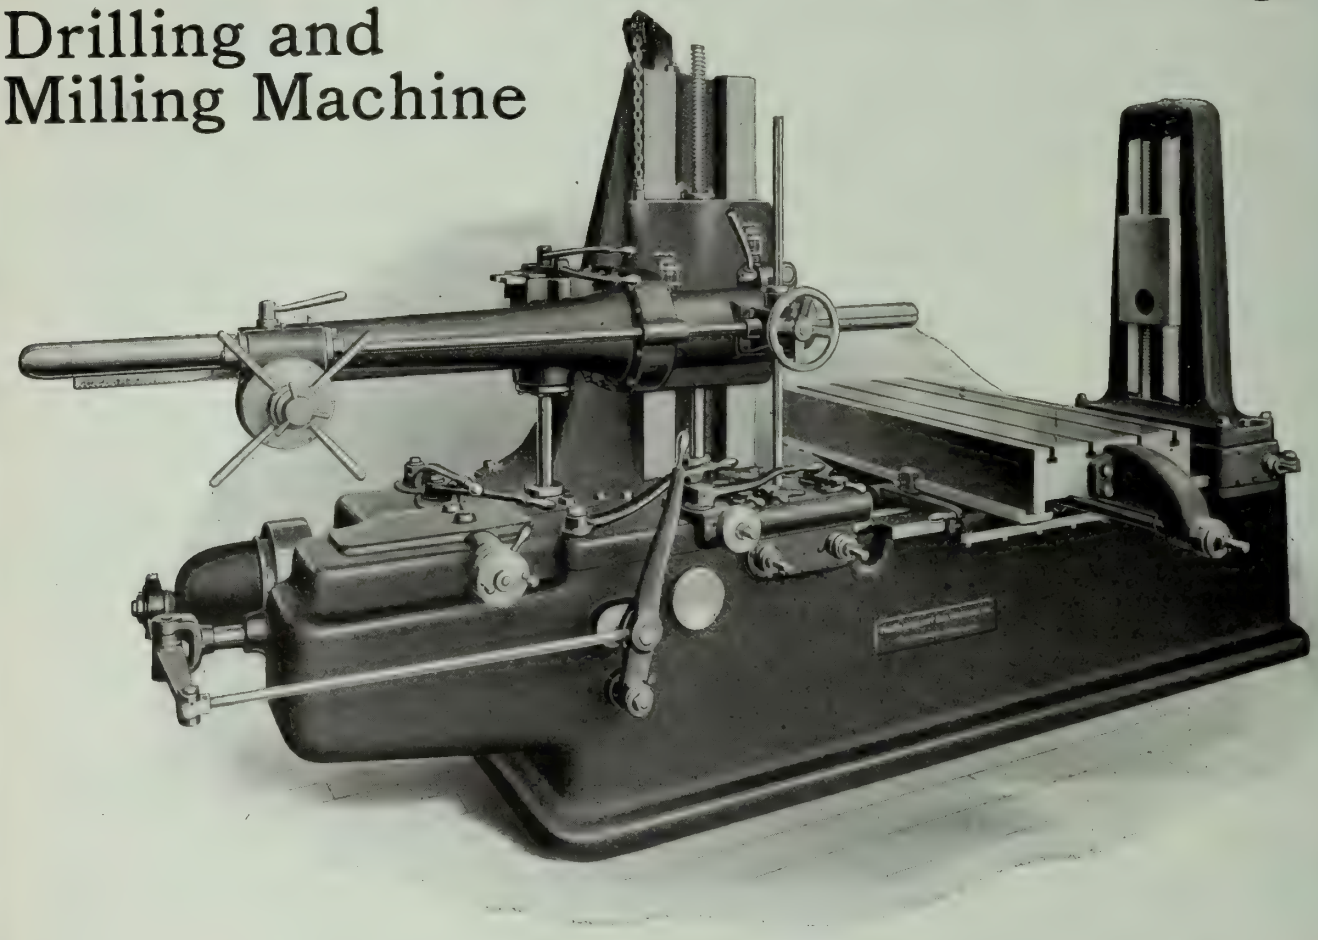
Ranges of spindle speeds in R.P.M.	16 to 196
Number of feed changes to spindle or table	9
Number of feed changes to spindle or table with back gears	18
Ranges of feed in inches per each revolution of spindle	.003" to .518"
Working surface of table	24" x 54"
Automatic longitudinal feed to table	36"
Automatic transverse feed or parallel movement of table with bed	37"
Maximum distance spindle nose to outboard bearing	5' 6"
Maximum distance top of plain working table to center of spindle	28"
Mixmum distance top of bed to top of table	10"
Diameter constant speed friction drive pulley	14"
Width of driving belt	4"
Speed of friction driving pulley (revolution per min.)	350
Weight crated domestic shipment (standard length) approx.	11600 lbs
Weight extra length of bed	1000 lbs.
Weight boxed for sea shipment (Approximate)	14000 lbs
H. P. motor recommended	5

Speed constant from 900 to 1200.

We prefer these standard motor speeds to obtain proper speed and feed ratios.

Other attachments such as circular swiveling table, auxiliary table, star feed and inserted tooth face milling cutters are furnished as extras.

The New "B.-E." Horizontal, Boring, Drilling and Milling Machine



The* Horizontal *Mill and Drill with the highest working efficiency. Note the one-piece deep base of a box pattern strengthening the bed where the greatest stress and strain exist.

Spindle Saddle is designed with a liberal surface on the face of the column, a long, narrow guiding edge, with single screw adjustable taper gib, for adjustments on one side and a square lock form with gib on the other side. This construction will always maintain and insure a perfect alignment for the spindle saddle.

CONVENIENCE AND SAFETY

is provided for the operator by placing all of the controlling levers to the front of the machine and high enough so he has no occasion to stoop or reach beyond that of his normal working position.

Garlock-Walker Machinery Company, Limited

MONTREAL TORONTO WINNIPEG

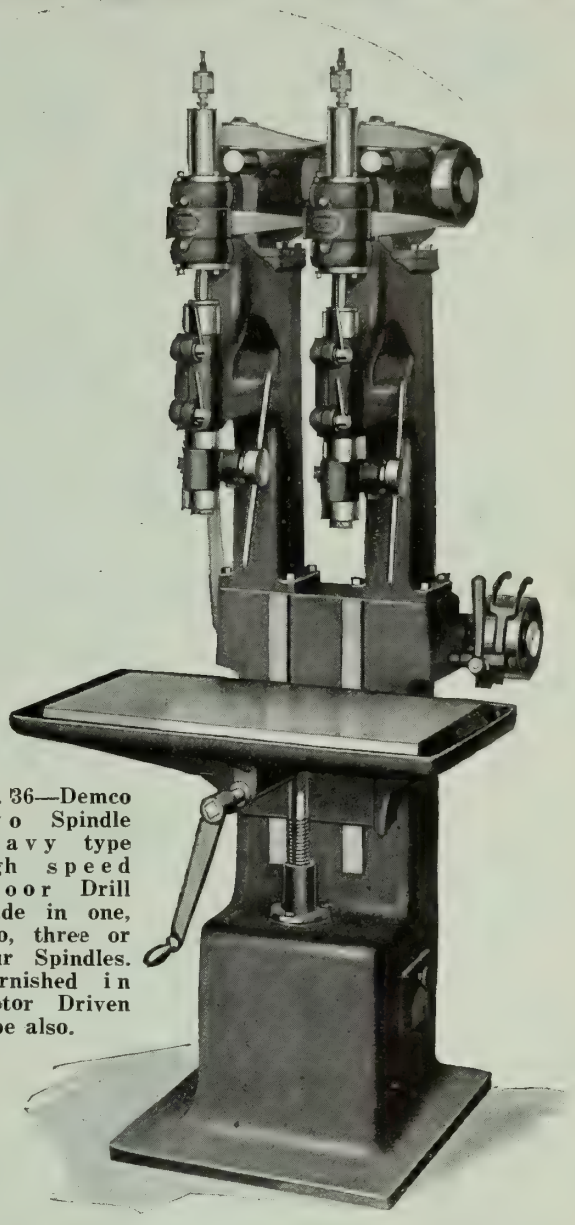
Noteworthy Features of

Demco
High Speed Ball Bearing
Drills

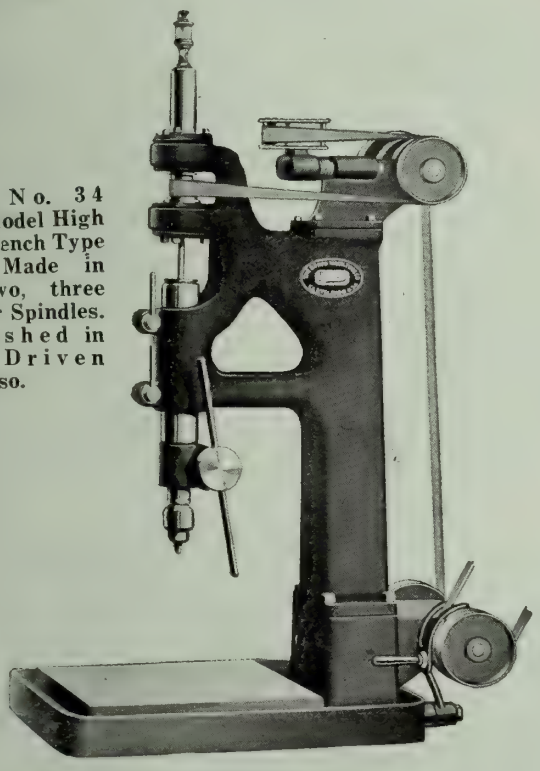
ALL moving parts are perfectly balanced and equipped with "Norma" Annular Ball Bearings, while a special automatic belt take up is provided to keep the belt in contact with pulley at all times.

The lack of vibration obtained by this design permits operating at a maximum speed of 12,000 R.P.M. This high speed avoids the necessity of unduly forcing the drill into the material and reduces drill breakage to a minimum.

Bench and Floor drills are made with 1, 2, 3 or 4 spindles. Choice of four different types of spindles is also provided.



No. 36—Demco two Spindle heavy type high speed Floor Drill made in one, two, three or four Spindles. Furnished in Motor Driven type also.



Demco No. 34 heavy Model High Speed Bench Type Drill. Made in one, two, three and four Spindles. Furnished in Motor Driven Type also.

THESE drills are made with the countershaft at right angles to the spindle arm and they are particularly adapted for driving by belt from overhead lineshafts.

They have the same characteristics and improvements as all other Heavy Type Demco Drills and are equally capable of producing a large volume of exceptionally high class work.

BRIGGS MILLER

Breaking Production Records

Forcing the feed on the "BRIGGS" to an extent impossible on any other machine.

THE photograph shows twelve belt lacer jaws clamped together on the table of a Briggs Milling Machine, where two straddle-mounted cutters mill the channels at one setting, though the stock is cold rolled steel, one inch thick. 15 minutes completes the operation, this speed being attained by forcing the feed to an extent impossible with any other milling machine. There is no chatter—the surface is "finished" when it comes from the machine.

Rigid, powerful and easy to operate. Takes wide, deep cuts without showing least signs of distress, and will produce accurate work when running at a high rate of speed.

3—Used FERRACUTE D-201 Vertical Double-geared Straight-sided Single-action Redrawing Presses, having capacity for exerting pressure of 200 tons. Length of stroke, 10″. Distance between columns, 32″.

1—Used FERRACUTE D-151 Vertical Double-geared Straight-sided Single-action Redrawing Press, exerting 150 tons pressure. Length of stroke, 13″. Width between columns, 32″.

6—Used FERRACUTE DGG-56 Vertical Double-Geared Straight-sided Single-action Redrawing Presses; 5 of these presses have 18″ length of stroke and 1 has 20″ length of stroke. Distance between uprights, 30″.

7—Used FERRACUTE DGG-56 Vertical Double-Geared Straight-sided Single-action Redrawing Presses, exerting 100 tons pressure; 6 of these presses have 15″ length of stroke and 1 has 12″ length of stroke. Distance between housing, 30″.

6—Used FERRACUTE DGG-55 Vertical Double-geared Straight-sided Single-action Redrawing Presses, exerting 75 tons pressure. Three of these presses have 15″ length of stroke and three have 18″ length of stroke. Distance between housing, 26″.

1—Used FERRACUTE C-5 Open-back Inclinable Cutting Press, Direct Belt Drive., that is, not geared, having capacity for exerting about 50 tons pressure. Length of stroke 2″. Distance from centre of ram back to frame, 12″. Width of opening through back, 18½″. Height of opening through back 7½″.

3—Used FERRACUTE PAG-4 Geared Adjustable Bed Punching Presses, having capacity for exerting 50 tons pressure. Length of stroke, 2″. Distance from centre of ram back to frame, 8½″.

3—Used FERRACUTE PA-3 Adjustable-bed Punch Presses, not geared, having capacity for exerting about 35 tons pressure. Length of stroke, 2″. Distance from centre of ram back to frame, 7″.

1—Used BROWN-BOGGS No. 215 Inclinable Power Press. This is a geared press. Arranged with 24″ x 6″ pulley. Distance back from centre of slide, 9½″. Distance from bed to slide, when up, 13¾″. Width between gibs, 11⅞″. Length of stroke, 4″.

7—Used FERRACUTE D-45 Horizontal Double-end-Screw Press designed for deepening or redrawing sheet metal tubes and shells about 3″ diameter and 18″ deep. Capacity for exerting 100 tons pressure. Three of these presses have length of stroke of 36″ and 4 have length of stroke of 40″. Diameter of ram screw, 6½″. Diameter of side rods, 5″.

2—Used E. W. BLISS No. 60½ Vertical Geared Rack-driven Presses. Length of stroke, 36″.

3—Used FERRACUTE E-57 Vertical Geared Toggle Coining Presses. Length of stroke, 3″.

5—FERRACUTE E-56, Vertical Geared Toggle Coining Presses. Two of these machines have 3″ length of stroke and 3 of them have 2″ length of stroke.

4—Used No. 666 Vertical Geared Toggle Presses, manufactured by the TOLEDO MACHINE & TOOL COMPANY. Having 2¼″ length of stroke and capacity for exerting 1,000 tons pressure on ram.

NOTE:—The above presses were all operating on manufacture of Cartridge Cases when work stopped about nine months ago. They were purchased new from manufacturers from February, 1915, to September, 1915, and have had about two years' service. They were not used continually since being purchased. Some have been repaired and all have been kept in good running order—Examination can be made in Montreal.

TERMS:—25% with order balance against Bill of Lading.

NOTE:—If these presses were to be shipped back to the United States there would be no duty to be paid—You would only require to add freight from Montreal to destination (except Brown-Boggs Press).

MACHINERY WILLIAMS & WILSON LIMITED MONTREAL

Used and New Machinery

Partial Selection From Our Big Stock:

PUMPS

One used 2" Downie Model A centrifugal pump.

Two size 5 Gould's centrifugal pump.

One size 2 Gould's direct motor driver centrifugal pump.

Two new Hydraulic Machinery Co. 4½" x 14" vertical hyd. pump.

One 6 x 4 x 6 Epping-Carpenter Duplex Steam Pump.

AIR COMPRESSORS

One 6 x 6 Nagle vertical air compressor.

One Canadian Ingersoll-Rand type R.P. 2, 29 x 12 x 16; 920 c.f.m. at 100 lbs. All in fine condition.

One used Jenkes Machine Co. class C B Air Compressor, size 10 x 10; capacity 190 c.f.m. Complete with unloading device.

One used Ingersoll-Rand class EL-1 Air Compressor, size 10 x 12; capacity 233 c.f.m. Complete with unloader. Practically new.

Two used Ingersoll-Rand 10 x 12 class E L-1 Air Compressors; capacity 275 to 290 c.f.m. at 100 lbs; 220 r.p.m. Complete with air receivers. All in fine condition.

One Canadian Ingersoll-Rand class P L B-2. Size 20 x 20 x 16; speed 225 r.p.m.; 1508 c.f.m.; 300 H.P. motor at 600 r.p.m. Motor pulley 31½".

ENGINE LATHES

Two used 26 x 10 C.M.C. quick change gear, 3 step cone, double backed gear.

Three 24 x 12 Whitcomb Blaisdell, practically new, quick change engine lathe. Four step cone, double backed gear, 4" belt.

One 22 x 10 Milwaukee engine lathe, three step cone, double back geared.

One 20 x 8' 6" Petrie heavy duty plain turning lathe, equal to new.

Three 20 x 8 C.M.C. standard engine lathe, three step cone, double back geared, in good condition, each lathe fitted with four jaw independent 14" chuck.

One new 18 x 8 Stevens standard engine lathe.

One used 18 x 8 Stevens standard engine lathe.

One used 18 x 8 Greaves-Klausman standard double back geared engine lathe.

One used 18 x 8 Mueller quick change gear engine lathe.

One used 18 x 8 Cincinnati quick change gear, three step cone, back geared engine lathe.

Two used 17 x 8 Sydney, very heavy duty, standard double back gear, in good shape and very heavy pattern.

One used 18 x 8 Milwaukee standard single back geared, having 12" independent chuck, in good condition.

One used 18 x 8 Milwaukee standard single back geared, having 12" independent chuck, and with taper attachment.

One used Hamilton 16 x 8 standard single back geared, type B, with 10" independent chuck fitted, in fine condition.

One old 16 x 8 McGregor-Gourlay engine lathe, good for someone wanting very cheap lathe.

One used 16 x 7 Hendey lathe, mounted in oil pan and with bracket for taper attachment, complete with regular equipment.

One 14 x 8 ft. Hendey used engine lathe; good condition.

TURRET LATHES

One used No. 6 Foster, geared friction head turret screw machine.

One used 24" Gisholt turret lathe, with taper attachment. Hole through spindle 4¼ inches, three step cone for 4 inch belt, chuck 24" diameter. Four square turret tool post.

Two 1⅝ x 7 New Britain six spindle automatic screw machines.

Ten No. 33 New Britain multiple spindle automatic chucking machines, equal to new.

DRILLING MACHINES.

One used 4' Bertram plain radial drilling machine, thoroughly overhauled and refitted.

One new 26" Aurora heavy type upright drilling machine.

Three new 20" C.M.C. upright drills.

Twenty used Henry and Wright No. A, class "B" ball-bearing sensitive drills. 15" swing.

100 Avey No. ½ single spindle ball bearing bench drills.

50 Avey No. ½ double spindle ball bearing bench drills.

Four used Leland and Gifford heavy duty ball bearing 14" two spindle sensitive drilling machines.

MILLING MACHINES

One new No. 3 Ford-Smith plain miller, 34 x 10 x 20.

One new No. 2 Ford-Smith full universal miller, 25 x 8 x 17.

One new No. 2 Ford-Smith plain miller, 24 x 7½ x 19.

One new No. 1 Dow plain miller, 24 x 7 x 18, all complete.

One used No. 1½ Rockford plain miller, having vertical milling attachment, also slotting attachment and universal dividing head in splendid condition.

Five used No 7 Becker Lincoln millers, with cabinet leg and oil pump, especially suited for key way cutting and manufacturing.

Six used No. 12 Pratt and Whitney Lincoln millers.

One used No. 1B Milwaukee universal miller, good condition.

GRINDING MACHINES

One used No. 2 Reid Bros. automatic surface grinder, complete with magnetic chuck, all in fine condition.

One used No. 3 Brown and Sharpe 12 x 40, universal grinder.

One used No. 70 Heald internal grinder, with type No. 7, style No. 1 head.

One used No. 1 Diamond automatic surface grinder. Range 24 x 12 x 9, with magnetic chuck.

One used No. 3 Wilmarth and Morman automatic surface grinder, with No. SF 8 x 20 D. and W. Fuse Co. magnetic chuck.

One ..o. 2 Brown and Sharpe used surface grinder, good condition.

One Landis used 10 x 30 plain grinder, good condition.

POWER PRESSES

Six used No. 18 Bliss fly wheel presses.

One used No. 73½ Bliss straight sided trimming press, fly wheel type, with side cutting off attachment.

One used 90-lb. Waterbury Farrell drop hammer, complete with power lifter counter shaft.

One used 120-lb. Waterbury Farrell drop hammer, complete with power lifter counter shaft.

One No. 4-A Styles adjustable bed power press, 4" stroke.

Two No. 8½ Zeh and Hahnemann patent percussion presses.

Two No. 10 Zeh and Hahnemann patent percussion presses.

Two No. 12 Zeh and Hahnemann patent percussion presses.

MISCELLANEOUS

Three 1" National triple head bolt cutters, capacity for threading ¼ to 1 inch diameter.

One 1½" National triple head bolt cutter, capacity up to 1½".

One Acme six spindle nut tapper, capacity ⅜ to 1 inch.

One 1¼ inch National semi-automatic nut burring machine, for burring all sizes from ⅝ to 1¼ inch.

One No. 1 Lapointe Brooching Machine, used, good condition.

One No. 3 Lapointe Brooching Machine, used, good condition.

FURNACES

Six Monarch No. 275 tilting crucible furnaces, in fine shape.

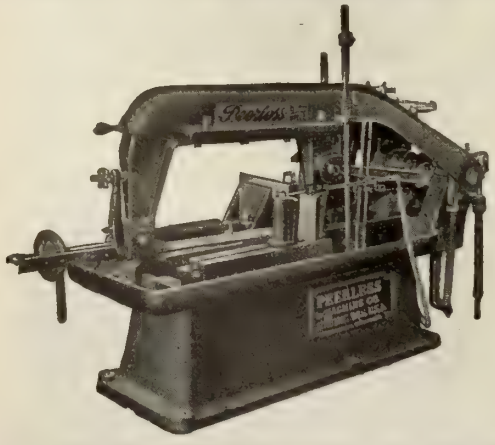
Peerless HIGH SPEED

Has Proven Its Efficiency Where Others Have Failed



DON'T turn down the "Peerless" because you have tried out other hack saws which did not answer your requirements.

Many concerns who were persuaded only with the greatest difficulty to try their first "Peerless," because they "just knew it would turn out like the others," are to-day among the largest and best-satisfied users of our High-Speed Saws.

The "Peerless" is different—and better. It does 50 to 100 per cent. more work, cuts with thinner saws and requires a minimum of attendance, saving time, labor, material, blades and floor space. What is your work? We can tell whether the "Peerless" will do it, and back our judgment with a 30-day trial. If it doesn't make good we pay freight both ways. Well?

PEERLESS MACHINE CO.

1607 RACINE STREET RACINE, WISCONSIN

Perfect Riveting

Send for "Perfect Riveting"

Provided its cost is the lowest possible, riveting so well done that it can't be improved upon, is perfect riveting.

Boys on Grant Riveters accomplish two and three times as much perfect riveting as an equal number of men using ordinary machines.

With the

GRANT

ROTARY VIBRATING RIVETER

rivets placed close up to the shoulder of the work are as rapidly spun, perfectly smooth as are rivets in easy-to-reach spots.

Making Production Men Sit Up and Take Notice

You can't judge a tool by an occasional fine performance. But no production man can ignore the long series of extrardinary service records made by

DAVIDSONIZED High Speed Steel Tools

Here's another rhcent performance, stripped to the naked facts (name of plant on request):

Clevis Milling Job. Four side-milling cutters on arbor, each 6 in. x ½ in. x 1 in. Material: High Manganese Carbon Steel, forged stock. Standard production speed, 150 pieces per 8 hour day. Best previous tool performance: 800 to a grinding.

In the competitive tests, the two outer cutters on the arbor were Davidsonized Tools, and the two inner ones of a well known standard make.

One of the inner cutters had to be taken off after 726 pieces; the second did 750. *After these* 1476 *pieces,* at which point the test was discontinued, *both Davidsonized Cutters were still in practically as good condition as at the start.*

Apply this comparison to some jobs of your own and see what it would mean to you in terms of your own costs. Figure not only getting out the same work with one-half the number of grinders, but the saving in the overhead and labor items through reduction of take-down and setting-up time. Then write us for further particulars, or say when our representative may call.

No. 66A

Crystolon Wheels for Snagging Brass and Bronze Castings

The physical properties of brasses and bronzes vary as do those of steel. An understanding of the effect of different metals on these properties is of interest and importance to those who are called upon to recommend grinding wheels for snagging castings made of brass or bronze.

Brass is an alloy of copper and zinc in varying proportions from 40 to 90% copper and for special uses other metals are added in small amounts. The tensile strength of copper is 26,000 pounds. This tensile strength is increased to 45,000 by the addition of 30% of zinc to the copper. As the alloy is changed to 50% of each, the tensile strength drops to 1,000 pounds. Since tensile strength is the property that resists the removal of material, a change in this property will, of course, affect the grade of the wheel necessary. With other factors remaining the same, the higher tensile strength will call for a harder wheel on snagging operations with sharp contacts and perhaps a softer wheel on snagging, broad contact, and on precision grinding.

Adding lead up to 3% makes a softer, weaker material which will be more apt to load a wheel and call for a structure that will break down more readily. A treated wheel should be tried on this material, if untreated wheels do not prove satisfactory. The filling used in a treated wheel becomes fluid during grinding and lubricates the cutting grain at exactly the point of contact.

Tin and manganese give a harder brass and may make the use of a harder wheel advisable for sharp contact and a softer wheel for broad contact.

Iron to the extent of 1 to 2% increases the tensile strength to 80,000 pounds and gives an iron that produces a very sound, uniform casting. Owing to this high tensile strength an alundum wheel may be found more efficient than Crystolon, as the latter, being brittle, may break down too fast to give best results.

Bronze is very similar to brass. Phosphorus, aluminum and manganese with copper produce bronzes that have a high tensile strength, higher in some cases than 20 point carbon open hearth steel. This may also be an Alundum proposition.

A fairly large number of different grains and grades have been successfully used. This large variation is due to kind of material, condition of machines, speed of wheels, operator, size of castings, condition of castings as they come from the foundry, and many other factors.

Crystolon wheels 24 grade Q and 30 grade P are more often tried and more often successful than the others. We would recommend these two wheels for trial first, unless some local conditions made the trial of some harder or softer wheel advisable.

CANADIAN MACHINERY
AND
MANUFACTURING NEWS

Volume XXII. No. 5 Toronto, July 31, 1919.

Do You Know Any of These Three Chaps?

HE occupied a fairly large place in the community. He was a manufacturer in a good way, and what he had to say about conditions generally carried some weight. In fact what HE SAID had quite a bit to do with what the community believed.

On this particular day this HE SAID individual stood on the corner just before parting company with the bank manager.

Of course the banker wanted to know his ideas about credits and the outlook in general. It was not possible to hear all that HE SAID, but such words as strikes, no output, hard winter, failures, high costs, were easy to hear. In fact, a person would not need to be an eavesdropper at all to get a whole earfull of real honest-to-goodness blue-ruin talk.

The banker went his way and HE SAID went his. Just as the banker was about to enter his office he met the man who used to attend to the furnaces in winter. Instead of saying, "Good morning, Joe," he stopped and asked Joe how things were going with him. "Fine," replied Joe as a starter. "Working every day at bigger pay than I ever hoped to get. My boy got back from France three months ago and he's working in the same shop. If you want to know how we're doing just take a glance at my savings account. It's right in your own bank here," and Joe was off with a smile.

And quite unconsciously Joe, the former furnace man, had put the axe into the burdock bush that HE SAID had planted in the mind of the banker.

Now as a matter of fact HE SAID was only a very ordinary individual.

Any croaker who decorates a sugar barrel in the old corner grocery could have handed out just as fine a line of headed-for-the-bow-wows talk. It does not require brains—it does not require courage, nor vision, nor executive capacity. Simply a wagging tongue and a bit of an audience—the rest is easy.

Nothing more was needed than that the tongue should wag and the audience not ask any pertinent questions that would confuse the wagger.

HE SAID lives in a good many Canadian centres. He is telling that coal is going to be very high this winter; that there will be an awful lot of people out looking for work; that building is almost at a standstill; that costs are high; that there is industrial unrest; that buying is from hand-to-mouth, and that our money is at a stiff discount in the United States markets.

Unfortunately there is no legal way of dealing with HE SAID. Certain animals can be muzzled during the hot days of August, but there is no muzzle for HE SAID. He is at liberty to go his way, throwing out doubt here and fear some place else.

The antidote lies in Joe, the former furnace man—Joe, the apostle of good news—Joe, the chap who knows enough to stay everlastingly at the harvest while the cutting is good.

If Joe gets along to boot HE SAID out of his job, he will buttonhole the banker and say that in spite of strikes, reported crop shortage, high costs, and all these things, that retail buying is heavy and payments good—that the world is short of scores of lines that must be grown or manufactured—that many big buildings must be gone on with very shortly—that failures of responsible firms are almost unknown—that Bolshevism has got a black eye—that the costs of the rest of the world are just as high or higher than ours.

Yes, Joe, the former furnace man, would have given the banker a real vision. He would have jumped into his mental horizon and shoved it back a couple of miles. The chances are that Joe would put more blue sky and sunshine into the banker's ideas than could have been hatched under any other circumstances.

Now, this is not visionary. HE SAID, Joe and the banker are real people, and they have been discussing real Canadian conditions.

They represent three conditions and classes in Canadian business. Sift them out and see where you fit in.

The *"Our Company"* Idea In the Establishment

Aiming to Create a Wholesome Atmosphere Where Strikes Are Unknown and Not Wanted—Some Ideas That Are Bringing Results and Which Are Well Worth Passing On to Others

By A. R. KENNEDY, Editor Canadian Machinery

Respectable Company:—

I send you heartful thanks for the flowers which were received on Saturday, and I am much better now.

I greet all those in the office and also Adam.

(Signed)

W. PANEK.

SUCH is the certificate of good character that one busy industrial concern in Hamilton prizes as highly as anything that has come its way. This particular certificate is not an embossed affair, neither is it framed, but it tells, in the heartfelt words of one of the foreign employees, just what the Benefit Club of the workers had done for him. His child had died, and the Club had seen to it that there was a decent funeral, with a generous showing of flowers. They had succeeded in making that poor lone foreigner know that they cared for him. The "Adam" mentioned, by the way, was the foreman.

Does this sort of work pay? Well, if you doubt it, a visit to the office and works of the Dominion Sheet Metal Corporation, in the industrial east end of Hamilton, will do considerable to iron out any skepticism that may linger in your system. The office is not far from the factory, and I mean that in more ways than one, both in distance and feeling and understanding. It was about 96 in the shade the day I was at the works, but there was ice water out in the factory just the same as in the office—in fact it didn't take long to "feel" that there wasn't much need of a strong organization in the works to see to it that the men got a square deal from the office. And there was a little notice posted up just outside the superintendent's office announcing that on a recent date the wages of all the men in the place would be advanced two cents an hour. No, there hadn't been a strike, not even a threat, nor yet a deputation from the men. Business warranted it, the men deserved it, and what more should be necessary?

Perhaps a Bit Modest

A. T. Enlow, the president and general manager of the company, is no theorist about conditions in the industrial world. He likes to turn on the steam and see how it works in reality.

But he has imperfections. From the standpoint of the interviewer he's too modest. He likes to soft pedal the stuff that would make a story stand right up. He seems to have a large-sized and very wholesome regard for the feelings of any of the men who have been helped a bit by the plans he has put into operation. We'll not use the word "schemes" in connection with anything that has been done at the Sheet Metal's plant, because there is nothing of the "scheme" idea about them. As far as I could judge there were straight, honest-to-goodness proposals, and there was "something in it" every time for the men in the shop.

Mr. Enlow probably has several reasons for the manner in which he conducts his business. One of them is that he likes to do it. Another is, so I was told by a friend of his, that in the beginning of his own career in business he was gouged pretty hard by the money-grabbing sort of employers, followed later by contact with big-hearted, noble-souled types and it aroused in him a determination, if the opportunity ever afforded, to employ the latter system. Then, too, and Mr. Enlow will admit this, he considers there is a large element of self-preservation in it, as far as the company is concerned. He is anxious to build up that greatest of all things, an organization from the office right through the factory that's working, and intends to keep on working for "our" company.

Not An Old Company

The Dominion Sheet Metal Corporation is not an old concern. It started to operate in 1915. The business is growing nicely, and a nice addition is planned for this year. Through all the time from the start to the present there has not been a man laid off, and the employees

PLANT OF THE DOMINION SHEET METAL CORPORATION, HAMILTON, AS IT WILL APPEAR WHEN THE ADDITION ACROSS THE FRONT IS COMPLETED THIS SEASON.

who hold stock have never been told that the dividend for the quarter or for the year has to be "passed."

To get at the thing right it might be well to start from the beginning. I'm not particularly interested here in the growth of the concern in a dollars and cents way, but more in tracing what can be found of the new feeling that must come more and more to the front in the industrial world. In 1916, it was decided to make a start with a five per cent. bonus to all who were in the employ of the firm on the 20th of December. Made a nice little Christmas present, and likely served as the corner stone for the many other things that followed.

1917.—The same five per cent. bonus was continued, and this time the staff were given an additional yearly bonus. The "Benefit Club" was also born this year, but the workings and particulars of this will be given later.

1918—Ten per cent. bonus to all; yearly bonus to staff; Benefit Club work enlarged; Garden Club and a tonnage bonus to the shop force.

1919—Staff bonus, tonnage bonus, the yearly per cent. will be paid, Benefit Club doing more and better work; stock offered to employees on very generous terms, and vacations for all with the time paid for by the company.

The Benefit Club Idea

Taking the name from the well-known brand of the shop, "Premier," the name of the Benefit Club is the "Premier." "All the employees put in fifty cents a month each," stated Mr. Enlow. "In fact it is no use having a benefit club if the men do not put some of their own money in. The company's share in the work comes from putting in the bonuses of the men who quit before the year is up. We simply take the yearly pay roll. We know what the total on that should be for bonuses, and we know what we have paid out. The difference goes to the Benefit Club. In 1917, we put in $780 and in 1918, $1,800. In this way the company does not gain in any way by an employee leaving."

At the outset plans were laid for quite an imposing set of rules and regulations. But then it was decided to try something simpler, and now, as far as I can gather, the rules and regulations state that the Premier Benefit Club exists for "social and beneficial purposes." Well that's pretty broad and pretty general. In fact it might be said that the sky's the limit as far as being confined in any one direction. But it works at any rate, and the letter quoted at the first of this article shows how the work is reaching home in a very certain and a very much appreciated way. This Premier Benefit Club does a number of things that it would be very hard to set down rules and regulations for. There are times, as in every other community, that the stork sees fit to visit the homes of some of the members. And after that call is over it is quite necessary and proper that a bit of a chariot be provided for the new arrival. Such cases have been attended to by the Premier Benefit Club. It would be mighty hard to draw up a set of rules which would cover such a happening, but without too many rules it is easy. Then again when a wedding takes place it is necessary—desirable at least—that something should be done. The committee thinks it over, and goes to it. When the "flu" came along there were, in the latter stages of the epidemic, several homes of employees invaded by the malady, and little ones were taken. There was nothing in the constitution either to hinder or suggest what action should be taken. But there was something better, the will to do the right thing. And so it was that on several occasions a good burial was made possible, and there was a nice showing of flowers, and nothing is more sacred, especially to the heart of the foreigner, than that a funeral from his house shall be conducted decently and in good order. There are a dozen more ways of looking after men than simply seeing that they draw a certain limited amount when they are sick, and the Premier Benefit Club is finding this out, and having a good time from it in the meantime.

The capacity of the galvanizing plant—for galvanizing is really the first and last work of the plant—is thirty tons per machine per day.

By careful planning and close application it is possible to shove the lid off that limit by quite a fair margin. So it was that early in 1918 a bonus was planned for the men engaged in the galvanizing operations. This worked well, but it was not broad enough. "All the men in the shop could not work on that particular operation," stated Mr. Enlow, "and so we recognized that they could all hinder or help the output. So we simply made the bonus applicable to the whole shop. As soon as the 30-ton output for the day has been reached we pay one cent per hour for each additional ton. That is, if the output for the day is 35 tons, the men in the shop get an extra five cents per hour for that day. I guess it averages about $10 per month to each man. And here is a little something," laughed Mr. Enlow, "that others may not have found out yet in the payment of bonuses. Put the bonus in a separate envelope. You know there are a good many married men in every shop, and good, well-trained chaps that they are, they like to present the pay envelope unbroken at the house. And they like to have this little bonus as something entirely their own. It is a good plan to keep the bonus separate. It takes only a little bit of work, the men want it that way, so that way it is around here."

Yearly Bonus to Staff

Depending on efficiency and service, there is a bonus paid to the staff, the exact figures of which, of course, are not for publication. I saw some of the figures though, and it is sufficient to say that they are large enough to earn the name of bonuses.

"You know," continued the president of the company, "it does not do to let a good man get away from you too easily. So we pay the bonus according to worth and service. We are starting now to pay quarterly instead of annually. We find that is far more popular with the men. It may amount to about the same in a year, but it comes four times as often and very often comes just when it is needed. For instance, a bonus payment coming due at this time of year is going to help quite a bit when a chap is considering what he and his wife and family are going to do about the holiday business."

Holidays For All Concerned

The company is adding another sprout to the tree this year in vacations for all. That is just what it means.

Several years ago, after the Sheet Metal Corporation got established in Hamilton, they bought a piece of land in the best hunting ground of Northern Ontario. A car was sent up in that direction with a goodly supply of their own material and a snug little cabin was set up in the woods. The superintendent was asked to keep an eye out during the season for the men in the plant who were doing good work. Well, along in the fall the list was made out and the lucky, but deserving dozen, were told to quit work and get ready. The company staked them to the grub pile. a chef, dogs, guide, guns and ammunition, and they set forth to shoot up the North for a couple of weeks in the hunting season. I haven't time here to tell just what the men say of this trip. But it was not only a good time for the dozen, it was the planting time for the general holiday seed.

"After these men had gone," remarked Mr. Enlow, "I thought it over again, and it occurred to me that they can't all be stars. There must always be the average man, just as deserving as the other chap who is perhaps a little more brilliant. So this year we are going on with the hunting expedition plan just the same, but we are going to give every person a week off with full pay."

Selling Stock to Employees

If the agreement between the company and the employees, presented below, is carefully read, it will be seen that there is an effort made to make it possible for the employee to get his stock paid for quickly by crediting him with the earnings of a like amount of common stock. He is really earning 14 per cent. on his stock during the period of payment. He is guaranteed eight per cent. after that, and a desire on the part of the company to protect itself against anything unseen that may happen in the future keeps it from putting in writing any further promises. The desire is there, and it would not be surprising if better than eight per cent. were done after the stock is paid up, although it must be admitted that there are mighty few eight per cent. propositions available at the present time.

Here is a copy of the application for preferred stock of the company. Just to show how it works out the blanks have been filled in as though the amount were five shares:

Applicants For Preferred Stock

June 28, 1919.

To Employees of Dominion Sheet Metal Corporation, Ltd.

Kindly note conditions of this issue and signify your consent to same by signing this agreement in duplicate, retaining one copy.

Your allotment is 5 shares.

The certificates will be dated June 1st, 1919, and carry regular 2 per cent. quarterly dividends from that date.

You agree to pay $10.00 each month beginning June, 1919, which payment is to be applied against total of $500.00 in purchase thereof.

In addition dividends of 2 per cent. will be credited as declared and paid by Dominion Sheet Metal Corporation, Ltd. No interest will be charged on unpaid balances under this agreement.

At the close of our fiscal years, November 30th, 1919 and 1920, you will receive credit to correspond to the annual rate of dividend paid on the same number of common shares of the Corporation's stock, and quarterly during 1921 at the quarterly rate paid on Corporation's Common Stock until final payment is made.

When final payment is made the stock will be delivered to you by Dominion Sheet Metal Corporation, Ltd., and thenceforth will carry regular quarterly dividends as paid on Corporation's Preferred Stock.

Prior to final payment, or on termination of your employment before final payment, you shall be entitled to transfer your interest to any other employee who will agree to pay balance on original terms, and who shall receive the same dividends and credits, or to sell stock to anyone not an employee provided said purchaser pays balance due to Dominion Sheet Metal Corporation in one payment forthwith, and who shall thereafter receive regular dividends as declared and paid on preferred stock.

It is agreed that Dominion Sheet Metal Corporation, Ltd., shall retain stock in their keeping until final payment.

The employees subscribed under this plan for one hundred and eighty shares, against which one hundred shares, par value $10,000, were allotted for the initial issue.

The Housing Problem

Eight of the company's sixty employees who were confirmed "tenants" bought houses during the past two years. There would undoubtedly have been more if the company's list of employees had been larger. But it is growing. Mr. Enlow can hardly hide the fact that he is just a little bit proud of the class of houses that his men are getting. He doesn't like the "housing" scheme in the ordinary sense of the word. I don't think he would like to have the employees of the Dominion Sheet Metal Corporation living in a row of houses all the same, with no front yards, and no back yards and no play ground but the street. "The average value of the eight houses of employees who went into the housing business this year was $4,400," stated Mr. Enlow. The company has no housing scheme, in the generally accepted meaning of the term, but I happen to know that Mr. Enlow makes it his business to find out how and where the men in the shop live. He has gone to more than half a dozen this year and advised them to buy. When that big problem of making the first payment so that there should be no second mortgage has come up the president has done the solving. These eight required an average of $560 to finance the start. They got what they needed. They went in and bought the house they wanted in the district they wanted. They didn't have to buy where the company wanted to build, nor did they have to locate across from the shop. The houses are pretty well distributed. Four of the eight don't owe Mr. Enlow any money now, and the other four are coming along splendidly with their monthly payments. There is no set policy for the company in this regard, but there's something quite a bit better, for here's what the president of the concern told me: "You can't have contented and happy conditions in a shop until you have your men living in good homes under good circumstances. The men don't live in the factory all the time, and a home life has a lot to do with the efficiency of the man."

And there are other things that go on around the plant at Hamilton, but they are not going to be printed in full here. But there is a good feeling in the office toward the factory, and there is a good feeling in the factory toward the office. That place is going to grow. If it doesn't then all the laws of right and wrong must be shot to pieces. There is a nice addition going on this year, right across the front of the premises. It is shown in the picture of the works in this article.

Out of it all Mr. Enlow is getting something bigger than dollars or dividends. I imagine that at times he has a pretty good session watching these plans work out, and I know that the letter from the foreigner, Panek, in which he addressed the concern as "Respectable Company," was remarkably well preserved.

"Any trouble in keeping our hands here? Not now, or even when the munition making was on," said Mr. Enlow in conclusion. "We feel that we are under a moral obligation to keep our men at work steadily. This plan of laying men off just as soon as work falls off a little is not right. It sets the worker back too far. It is the steady position with good conditions that will hold your men and secure results. When munition making was on we used to have foreigners right at our office door trying to take our men away to jobs where they promised them twice as much on piece work. Some went but they came back and we took them on, and they are still here. I would not say that all the things we try out are practicable all over, but they work here."

There's somewhat of a wholesome philosophy to the entire surroundings at the Dominion Sheet Metal Corporation. It's not bound up with red tape. I imagine that if any man in the plant had a complaint that could not be adjusted with the foreman or the superintendent, he wouldn't have much trouble getting a hearing with the president. The atmosphere is not there for breeding trouble. Although none of the company officials said so, it looks as though they had decided to go ahead and get something better rather than wait around for something worse to arrive.

Steel Mill Electric Drive

During the war many steel mills which had hitherto been steam-engine-driven substituted electric drive for all additions to existing plant. The fact that electrical equipment could be put in quickly and at smaller expense was responsible principally for this change. The electric drive has been fully justified, and the writer looks forwards to an increase in the electrical operation of the steel mills. A more common use of central-station power has been made during the war period in particular. It has been a factor in facilitating installations and also offers many advantages in reduction of first cost of plant, reduced cost of operation, and in permitting greater flexibility of plant layout for future improvements. More than 50 per cent. of the motor equipment installed during the last two years use central-station power and more than 60 per cent. are 60-cycle units. The tendency toward the adoption of 60-cycle apparatus as a standard is very marked. —Brent Wiley in the "Review," May 10, 1919.

Goldenrod not responsible for hay fever.—A protest has recently been raised against the time-honored project of adopting the goldenrod as the national flower of the United States, on the ground that this plant is a cause of hay fever and hence nothing ought to be done that would encourage it prevalence. A statement has now been issued by Dr. W. Scheppegrell, on behalf of the American Hay-fever Prevention Association, in defense of the goldenrod. It is asserted that while the pollen of the goldenrod may cause trouble when applied directly to the nostrils or used in large quantities for room decorations, as a cause of hay fever out of doors it is absolutely negligible. "It is one of our most beautiful flowers," says Dr. Scheppegrell, "and well merits its selection as the national flower of the United States."

The Arctic Night

Viewed solely as a matter of optics, the Arctic night is as dark as any night. Explorers in high latitudes say, however, that there are many alleviations of the obscurity. The stars flash keenly, the moon comes along in a regular succession of phases, the snow surface relieves the gloom under conditions of the utmost absence of light, and the aurora borealis is the finest kind of illuminant. Explorers all agree that their men pass the winter night without much difficulty if only there are means of amusement.

It is estimated that at the present rate of consumption the United States can make its coal deposits last till the year 2300. England claims their supply is sufficient for three hundreds, and still the coal goes up in price. However, we should worry, for while the price is high, we at least know coal will not flicker out before we shuffle off.

Sir Robert Borden, the Premier of Canada, in a statement dealing with the natural resources, of the Dominion, emphasizes the great source of potential energy in the form of water power. On the River St. Lawrence alone, between Lake Ontario and Montreal, he estimated that Canada has the opportunity of developing 2,500,000 h.p. The Premier's statement says in part: "This asset has already been considerably developed, especially in the Provinces of Ontario and Quebec. It lends itself to the development not only of manufacturing industries but of agriculture. Conducted to the rural districts by great distributing lines, it is employed on the farms in many useful services. The opportunity which it gives for industrial development is almost beyond imagination."

British Geological Society admits women members.—Another of the leading scientific societies of Great Britain, the Geological Society, has decided to admit women as fellows. This step has been considered by the society on three previous occasions, with negative results.

The Department of Agriculture has started a campaign against careless threshermen. It wants only "clean straw ricks" left of the greatest grain crop the nation has known, so the threshermen will be aided by the Government to develop efficiency and avoid loss in separating the wheat from the chaff. Records of the Department reveal startling losses of grain "through avoidable waste of the threshermen." Tests made in "just ordinary" crop years show that an average of from 25,000,000 to 27,000,000 bushels is thus thrown away.

RECOGNIZING THE HUMAN SIDE OF INDUSTRY

Bridging the Gap Between Office and Shop is Worth a Great Effort.

By A. R. Kennedy.

One view of the First Food at Cost Cafeteria at Massey-Harris Plant, Toronto.

THE Massey-Harris Co. have considered a large number of plans for bringing the men in the shop closer to the management, and likewise the management closer to the men in the shop. A large number of plans were considered, and a large number were thrown aside. The plan now has settled down principally to two plans—(1) The industrial council and (2) the selling of stock at very advantageous terms to men in the works. The plans cover the works at Toronto and Brantford, also the associate companies, the Verity Plow Company at Brantford, and the Bain Wagon Company at Woodstock.

The Industrial Council

Mr. J. N. Shenstone, vice-president of the Massey-Harris Co., discussed the matter at some length with CANADIAN MACHINERY. "We do not claim that all the ideas in the industrial council originated here," he stated. "We went over a large number of plans, and wherever we found a good idea we simply wrote and thanked the firm that originated it. One thing that was uppermost in the mind of the whole management was this," continued Mr. Shenstone, "it may have come as a result of the war, but we are certain that the men in the shops are entitled to a greater share in the profits of industry. And along with this we want them to feel a greater responsibility for the carrying on of the work. Under the plans we now have inaugurated the management expects the representatives from the shops to suggest improvements in working conditions. If things are not right we want them to come right out and say where they are wrong, and wherein they can be benefited. The same thing applies to sanitary and other conditions. We want the men to help us to make the conditions desirable ones in which to work. We realize that there are obstacles in the way of forming and operating an industrial council, but we are determined to make an honest effort to bring about a feeling of mutual satisfaction. It is well worth the effort, because without such a feeling existing results can never be secured.

Yes, the Women Vote

"The plan we are working on now," continued Mr. Shenstone, "in regard to selling stock in the company is simply a continuation of the scheme that has been in effect for some time. For several years after the formation of the company all the shares were held by the founders and their families. Some ten or twelve years ago the share list was considerably expanded by the sale of several large blocks of stock. At that time we thought it would be well to interest some of the heads of departments, and they were able to secure their stock on very advantageous terms. This plan has been going on since, and now with the latest effort we have some 400 shareholders, including branch managers, sales staff, heads of departments, mechanics, and office staff. It is impossible to see how much this list will expand, but we want it to grow. When conditions become settled the number should increase to at least one thousand, and we do not want it to stop there."

The Offer of the Company

In a notice sent out on the 28th of May the company states:—

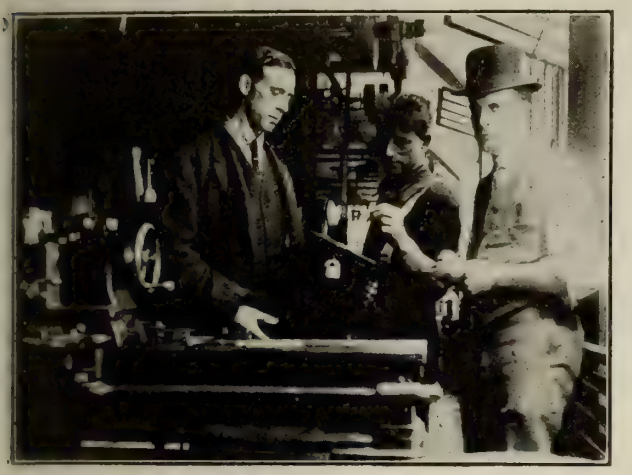
"The directors are strongly of the opinion that the interests of the Company and its employees are interdependent and are, therefore, desirous that the share list should include many more of the men and women on its staff in the various branches and factories.

"From our experience with the sale of Victory Bonds, we believe that a large number may be able to buy some shares at once, paying cash for them and adding to them from time to time as they can save additional money. We realize, however, that it would not be possible for many to purchase shares in the ordinary way, and pay cash for them, but we feel sure a large percentage of our employees could buy a moderate number of shares and pay for them on extended terms of payment.

"In order to provide an investment for those who have some money saved and to promote thrift among others, at the anuual meeting of the company,

held in April last, the shareholders authorized the directors to set aside $500,000 par value of the Company's treasury stock for sale to employees who have been in the Company's employ for two years or more, and who are not receiving, in wages or salary, more than $2,000 annually.

"It was decided that these shares might be sold, when necessary, on very advantageous terms to the purchaser, namely, on a basis of par ($100 per share) 10 per cent. to be paid in cash with the application, and 10 per cent. monthly thereafter, interest at the rate of 6 per cent. per annum to be allowed on all payments. Thus any payment made on account of the purchase of shares will earn interest at the rate of 6 per cent. per annum from the day it is paid in. Purchases under the instalment plan will be limited to 10 shares. Any shares paid for



Voting for Shop Representative

in cash will have right to dividends from date of payment. The stock that is thus being offered for purchase is exactly the same as that held by all the present shareholders without any restrictions beyond those applying to the present holders. The directors are greatly in hopes that under these favorable conditions, the employee shareholders will reach into the thousands instead of hundreds, as at present."

The Working of the Industrial Council

The industrial council and its workings is well set forth in a neat booklet prepared by the company. In short, the idea is that there shall be representatives duly nominated and balloted for in the various departments, with an equal number named by the management. The purpose is explained as follows:—

Massey-Harris Co., Ltd., and its employees, adopt this plan of a council in order to provide effective communication and means of contact between the employees and the management on matters pertaining to industrial relations so as to establish these relations upon a definite and durable basis of mutual understanding and confidence and to promote the common welfare.

The council shall consider questions of policy relating to wages, hours, employment and working conditions, works, practice and rules, safety and prevention of accidents, sanitation and health, and other similar matters of mutual interest.

For this purpose the employees and the management shall have equal representation on the council.

The council shall be concerned solely with shaping the policies of the company relating to the matters mentioned above. When the policy of the company as to any of these matters has been settled by the council, its execution shall remain with the management, but the manner of such execution may at any time be a subject for the consideration of the council.

The Organization of the Council

There shall be organized at each factory a council composed of representatives of the employees and of the management.

Employees shall elect from among their own number duly authorized representatives, to act on their behalf on matters of special interest to employees and of general concern to the company.

The management representatives shall be appointed by the management and shall not exceed the representatives of the employees in number.

The representatives of the employees and of the management shall have an equal voice and voting power in considering matters coming before the council. Through this council any employee or group of employees or the management may at any time present suggestions, requests or grievances with the certainty of a full and fair hearing. Matters which cannot be thus disposed of may, as hereinafter provided, by mutual consent, be submitted to impartial arbitration.

Number of Representatives

The basis of representation shall normally be one employee representative to every one hundred and fifty to two hundred employees, but in no case shall there be less than three employee representatives in the council.

Each works shall be divided into voting divisions in such a way that the several departments and crafts may be fairly represented.

In any works where 100, or over, women are employed there

Cafeteria of Massey-Harris Co., at Their Toronto Works—Capable of Handling 700 People—A Very Good Meal Can be Served Here for 22 Cents.

The Industrial Council of the Massey-Harris Co. in Session—Photo Taken at the Toronto Office at a Regular Meeting.

shall be a woman representative on the council, to be elected from among themselves, by the women employees who shall form a voting division for that purpose. Women employees in any works where less than 100 women are employed will vote for the men representatives in their respective voting divisions.

Who is Eligible?

Employees who are Canadians or British subjects by birth or naturalization, twenty-one years old or over, and who have been continuously in the service of the works for two years immediately prior to nomination shall be eligible for nomination as employee representatives. Provided that any time lost in military service, sickness or lack of employment for which the employee is not responsible is not to be reckoned.

Foremen, assistant foremen and other persons having the power of employment or discharge shall not be eligible for nomination.

Nomination and Election

Nominations and elections of employee representatives shall be by secret ballot and be held semi-annually in the months of June and December.

Nominations and elections shall be conducted by the employees themselves with only such assistance from the management as may be required.

All employees, both men and women, who are 18 years of age and over, shall be entitled to vote, except foremen, assistant foremen and other persons having the right of employment or discharge.

On the date fixed for nominations a secret vote will be taken. A blank ballot stating the number of representatives to be nominated from his voting division will be offered to each duly qualified employee present on the day of the nomination.

The employee will write on his ballot the name of the person he desires to nominate. If his voting division is to elect one representative, then one name shall be written on the ballot; if his voting division is to elect two representatives then two names, and so on.

Each employee will deposit his ballot in a locked box, carried by a scrutineer representing the employees who shall be accompanied by a time-keeper.

In voting divisions from which one representative is to be elected the two persons receiving the highest number of votes shall be declared nominated. If any voting division is to elect two representatives, then the four persons receiving the highest number of votes shall be declared nominated, and so on.

Three days after the voting for nominations has taken place the voting for election (by secret ballot) shall be held in the same manner as the voting for nominations, except that at the election only the names of the persons who have been nominated shall appear on the ballots and only these persons can be voted for.

The representatives of the management on the council will be appointed by the management promptly after the election of the employees' representatives. The number of management representatives on the council shall not exceed the number of elected employee representatives.

Method of Organization

The management will name a person to act as chairman of the council. A secretary shall be appointed by the works manager or superintendent of the works. Neither the chairman nor the secretary shall have a vote.

The company will provide at its expense places for meetings of the council and its sub-committees.

Employees' representatives on the council shall receive their regular pay from the company during such absence from work as this service actually requires.

Employees attending any meetings at the request of the council, or any sub-committee, shall receive their regular pay from the company for such time as they are actually and necessarily absent from work on this account.

How the Council Works

Any employee or group of employees who have been unable to make an adjustment of any matter with the foreman of the work on which he or they are engaged and who desire to bring such matter before the council may present it to the secretary of the council either personally or through their representative. The secretary shall first ascertain whether the matter has been properly presented through the proper channels

to the superintendent, and if not he will see that this is properly done.

If the matter is not satisfactorily disposed of in this manner, the secretary shall submit a written statement of the matter to each member of the council at least three days before the next regular meeting.

Any employee or group of employees thus referring a matter to the council shall have an opportunity to appear before it and present the case. Any such group of employees shall select not more than three spokesmen from their own number to appear before the council.

The council may call any employee before it to give information regarding any matter under consideration. The council, or any sub-committee appointed by it for that purpose, may go in a body to any part of the works to make investigations.

When the council reaches an agreement on any matter, its recommendation shall be referred to the works manager and superintendent for execution, except that if the works manager and superintendent considers it of such importance as to require the attention of the general officers, it shall be immediately referred to the President of the company who may either approve the recommendation of the council and order its immediate execution by the works manager and superintendent or proceed with further consideration of the matter as hereinafter provided.

In case of a tie vote in the council it shall be in order to re-open the discussion and to offer substitute or compromise recommendations, on which the votes shall be taken in the same manner as above provided.

Further Provisions

If after further consideration, the vote in the council remains a tie, then the matter shall, at the request of either the employee representatives or the management representatives, be referred to the President of the company.

The President, or his specially appointed representative, may confer with the council as a whole or any sub-committee thereof, or any group of employee representatives, at such time and place and in such manner, as in his opinion, will best serve to bring out all the facts in the case.

Within ten days after the matter has been referred to him, the President shall either:

(a) Propose a settlement thereof, or

(b) Refer the matter directly to the general council to be formed as hereinafter provided for.

If the President proposes a settlement and it is not satisfactory to a majority of the employee representatives, and if after a further five days, no agreement has been reached, then the President may, if he deems advisable, refer the matter to a general council to be formed as hereinafter provided.

If the President decides not to refer the matter to a general council, or if upon reference to the general council the vote is a tie, then the matter may, by mutual agreement of the President and a majority of the employee representatives, be submitted to arbitration as hereinafter provided.

The General Council

Whenever in the opinion of the President any matter coming before any council affects other works of the company or the works of our affiliated companies, the Verity Plow Co., of Brantford, and the Bain Wagon Co., of Woodstock, he may call a general council and thereafter the local council shall take no further action thereon.

In the formation of a general council the works of the Verity Plow Co., Ltd., at Brantford, Ont., and the works of the Bain Wagon Co., Ltd., at Woodstock, Ont., shall be considered as units or works of the Massey-Harris Co., Ltd.

The general council shall be formed in the following manner: —The President shall issue a notice designating the several works which he deems jointly interested. Thereupon the employee representatives at each of the works designated shall elect two or more of their own number to act as members of the general council. There shall be one such member of the general council for each 500 employees or major fraction thereof except that no works shall have less than two employee representatives in the general council.

The management representatives in the general council shall be appointed by the President and shall not exceed the number of employee representatives.

Reasonable travelling expenses, including hotel bills, of representatives serving on a general council, shall be paid by the company.

If the general council is unable to reach an agreement as to any matter it may, by mutual agreement of a majority of both the employee representatives and the management representatives, be submitted to arbitration.

All decisions of any general council or of any arbitrator or arbitrators shall be binding upon all the works originally designated by the President as being jointly interested. Any such decision may be made retroactive.

Independence of Action

Every representative serving on any council or general council shall be free to discharge his duties in an independent manner

The Noon-Hour Crowds Pouring Into the Massey-Harris Cafeteria—Patronized by Men and Women Alike.

without fear that his individual relations with the company may be affected by any action taken by him in good faith in his representative capacity. To insure to each representative his right to such independent action he shall have the right to appeal directly to the President, the council, or the general council, for relief from any alleged discrimination against him, and if the decision is not satisfactory to him, then to have the question settled by an arbitrator selected by mutual agreement.

The representation of employees herein provided shall in no way abridge or conflict with the right of employees to membership in any labor or other lawful organization.

The Massey-Harris Cafeteria

To the man who has become accustomed to looking for eating places in the down-town section of the larger centres, the bill of fare that is hung up in the Massey-Harris Cafeteria looks as though the prayer of the poet had been answered when he asked, "Backward, turn backward, oh Time in thy flight." For here he sees in front of him the makings of a perfectly good dinner for between 25 and 30 cents. When you go into the average restaurant down-town you pay for what you eat at a pace quite in keeping with the best traditions of the high cost of living. But here is what the writer saw in the Massey-Harris place:—

Vegetable soup	5c
Fried fish	12c
Baked beans	10c
Meat pie	12c
Potatoes	3c
Green peas	4c
Cake	5c
Pie	5c
Tea or coffee	3c
Milk	5c
Ice cream	5c

Bread and butter are free.

Just out of curiosity we noted the prices that were charged in one of the much-patronized down-town restaurants, comparing them with the Massey-Harris list. The helpings at the latter place are not skimpy. They are as large, or larger than one gets in the down-town section. But here are some of the prices compared:—

	M.-H.	Down-town
Soup	5c	20c
Fried fish	12c	35c
Baked beans	10c	35c
Meat pie	12c	35c
Green peas	4c	10c
Cake	5c	10c
Pie	5c	10c
Ice cream	5c	10c

Here, then, are eight items that Massey-Harris sell for 58 cents, while the down-town places get $1.65 for the same items. What's the difference? Simply this. The Massey-Harris Company do not plan to make a cent out of their cafeteria. They are satisfied to break even. Whether they do or not I am not prepared to state, nor would the officials say so. And the big eating house on King street is the equal of anything to be seen down-town. It will take in a crowd of between seven and eight hundred. The service is quick and the food good. Everything is clean, bright and attractive. Canary birds in cages are to be seen at a couple of dozen points. There is a rule to restrict smoking until 12.25, when the men are at liberty to light up and blaze away with their tobacco. There is a small stand in the room where tobacco can be secured, and also a few of the leading and more approved sorts of confections. No money is made on these sales, the idea being to break even on them. The chairs used are the variety seen in the lunch-rooms with the arm of the chair converted into the table. A number of square tables seating four are also to be noticed. These not only serve the purpose of a place to eat, but as soon as this is done with they are in demand when the pack of cards is brought out for a few hands before the noon hour is over.

In behind the scenes everything around the place is clean and bright and sweet. Good, plain ingredients are used in the preparation of the food, and all the cooking is done under wholesome conditions. There are no dark, smoky kitchens, no back lanes with garbage cans at the door. The cooking for this big factory dining-room is done with as much care and attention as could be given any place. The way in which it is patronized is the best evidence that it is a square deal and a success.

A cubic inch of coal pulverized so that 95 per cent. will pass through a 100-mesh screen will contain over two hundred million particles, none of which will be greater than one one-hundreth inch cube, and a larger percentage will be less than one six-hundreth of an inch cube.

A simple cable conductor has been in use for some time past, in Germany and other European countries. It consists merely of a flat metallic tube in which a series of notches are made with a special tool, after the two ends of the cable to be joined are properly inserted. The contact is said to be perfect, and the grip is such that the cable breaks before the connector gives away.

Montreal has a street cleaning device which sweeps the dirt to one side of the thoroughfare, where it is taken up by suction into a machine following up. Another feature of the road-sweeping scheme, is that sprinklers in front of each machine lay down the dust. Proving that ingenuity and machinery in unison make a wonderful combination.

Noise has no terrors for the new Magnavox anti-noise transmitter, which was used on all the airplanes of the United States Navy. This device was patented nearly two years ago, but only recently released for commercial purposes. No helmet is necessary for the listener, but still the voice is distinct whether one or one hundred miles away. E. S. Prideman, and P. L. Jensen are the inventors of this interesting telephone aid.

Nearly all animals are said to be better swimmers than man, and to take to the water naturally. The rhinoceros and hippopotamus are wonderful swimmers and divers, while the Indian elephant crosses great rivers with heavy loads. The elk keeps its head above water and crosses directly from bank to bank to avoid turning. The reindeer, on the other hand, turns as often as it likes, keeping its head only a little above the water. But of all swimmers, of all climes, the best, though not the swiftest, is the polar bear, which passes half its time in the water, swimming and diving.

The Eiffel Tower, the tallest structure in the world, was erected by Alexander Eiffel, a French engineer, for the exposition of 1889 at Paris. It stands in the Champ de Mars, and is 984 feet high (429 feet higher than the Washington Monument). The base is a square of 112 yards, from each corner of which rise the four curving supports of interlaced iron-work. At a height of 590 feet these merge into a single shaft. There are three platforms at various heights, to which the ascent is made by elevators or staircases—1,927 steps in all. The total cost was over $1,000,000, of which the State contributed about $300,000. In 1909 the Tower became the property of the City of Paris.

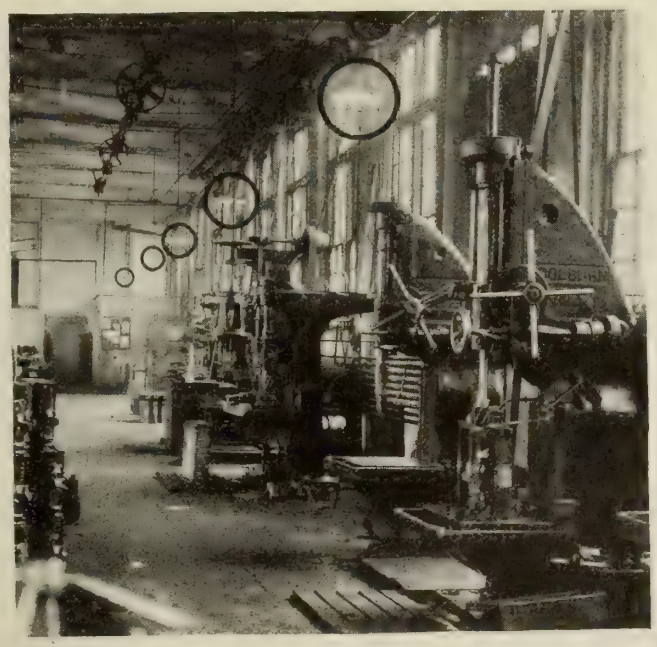
The Science of Efficient Shop Illumination

The Subject of Shop Lighting is a Very Vital One, For Without the Proper Illumination, Workmen Cannot be Expected to Produce Results, Either From a Quality or Quantity Standpoint

By A. W. SWAN

A GREAT deal has been written on the subject of illumination, usually with a free use of technical terms, and sometimes rather confusing to the non-technical manager and superintendent who are interested in having good lighting conditions in their plants. Further, the special bulletins issued by the electric manufacturing companies, while filled with very valuable material, usually recommend the installation of some form of semi-indirect or indirect lighting, which is as a rule expensive to instal. Now, it is quite possible to have a very efficient lighting scheme, and having nearly all the advantages of the more expensive schemes, at no advance in cost over the ordinary shop lighting scheme, simply by re-arranging existing units.

The science of shop illumination, reduced to its elements, is simply a matter of two factors, illumination per square foot, and absence of glare. The illumination per square foot depends again on two factors, the distance apart of the lamps and the power of the units. Taking illumination first, the choice is evidently between having low-power units close together or high-power units farther apart. While the general illumination is more uniform with the first system, it is also very expensive from the renewal standpoint; on the other hand, with very high-power units, such as the arc lamp, the difference between the best-lighted sections and the poorest-lighted sections is very great, and this is of great importance in the machine shop. Although it is sometimes possible to arrange for a machine shop being lighted entirely without the use of drop lights at the machine tools, this is not as a rule possible in the ordinary shop with its belting, etc., and low-power drop lights are necessary at the individual machine tools, particularly where the work is at all fine. At the time of the Russian 75-mm. shell contract, which was distributed throughout the Eastern States in 1916, the Government inspection bureau was not allowed to work in the evenings, although the lighting was excellent; and where parts are ground to limits of 1/1000", for instance, it is evident that even with the best general illumination, there must be provision for drop lights at the machine.



NOTE THE POSITION OF THE LIGHTS.

From all these standpoints it appears that a shop lighting system having 200-watt lamps for main lighting, with 25-watt drop lights has much to commend it, and as a matter of fact, this is a system in general use. But it is one thing to have the right power lights, and another to have them spaced correctly. The average machine shop has the machine tools arranged in aisles back-to-back; the lights are conveniently arranged with one row per double row of machine tools. Without going into the matter of candle-power per square foot, it will be found that with a spacing of 15 ft. between rows, having the lamps 15 ft. apart in the rows gives very satisfactory results in the ordinary machine shop.

The principal objection raised to the use of bare lamps, particularly of the modern high-power Mazda, is that they cause glare. However, this objection can be met by suspending the lamps at the right height and using the correct reflectors. The sensation of glare is caused by looking directly at any very brilliant object, therefore, any lamp of high brilliancy coming within the ordinary range of vision must be shielded from direct view. But the ordinary range of vision is not far from the horizontal, any very brilliant light directly overhead, or almost directly overhead, does not cause much trouble from glare as it is outside the ordinary range. On the other hand, owing to perspective, the further off the object the nearer it is to the apparent level of the eye; or in other words, a bare light which will not be annoying to the workman almost directly underneath will be troublesome to his neighbor further down the shop. It follows from this that if bare lamps are used, they must be used with some type of reflector that will shield them from those not directly beneath them. This is readily accomplished by the use of flat bowl reflectors, where the edge of the bowl is slightly below the tip of the lamp. Such a reflector cuts off no light from those directly beneath, but the lamp is above their normal range of vision, and will cause little annoyance. On the other hand, the reflector bowl will shield the eyes of workers in other parts of the shop. An important point is, of course, that the that the lamps should be suspended at the correct height; if too high, the reflectors will have to enclose the lamps more than at a moderate height. As a matter of fact, the best height both for general illumination and lack of glare seems to be about 10 feet.

The accompanying photograph shows plainly the type of installation described. It will be noticed that the flat bowl reflector cuts off all direct view of the more distant lamps, and even in those nearer, only the lower part of the lamp bulb is visible. Those almost directly overhead would be visible, of course—if one cared to look at them, but the range of the camera represents quite well the normal human range, and any lamp that cannot be seen in the photograph is not likely to be harmful.

Of course, such an installation leaves a good deal to be done in the way of providing perfect illumination; glare can never be avoided where bare lights are used, but the installation illustrated gives very good results; it is very economical—the reflectors are of metal and practically everlasting, and the general effect is quite pleasant.

Making *Foundry* More Attractive

BETTER and More Wholesome Shop and Working Conditions Would Do Much to Make the Foundry a More Attractive Place in Which to Work.

By F. H. BELL,
Editor Canadian Foundryman

Old Egyptian picture showing Molders or Iron Workers at their work—about the time of Thothmes III., 1490 B.C.

IS there any good reason why work in a foundry should not be carried on in surroundings far more cleanly, bright and wholesome than in the majority of shops at the present time?

It is a hard matter to get apprentices for the foundry. Men who are in the trade do not, in many cases, advise their boys to follow in their footsteps.

What is the remedy? Why not consider better shop conditions, better ventilation, better facilities for the handling of heavier work?

There has been a falling off of moulding shop apprentices—almost to the zero point in many cases, and some of the large employers go as far as to state that it will be a matter only of a few years until the molding business is largely in the hands of foreigners.

In order to properly comprehend the significance of the subject under discussion, it would be as well to first consider the origin of the term "foundry," which has its derivation in the word "found"—to begin, to establish, to originate, to endow, etc. Thus a foundry is a place where things are begun, or established, or originated, or endowed, or in other words, where they are founded. The man who operates a foundry is a founder because he does founding, which is to say, he produces the foundation on which the machine, or implement, or device is founded or built.

From time immemorial the founder has held a prominent place in providing mankind with implements of every description, but never to a greater extent than to-day; the only difference being in the manner in which his services were appreciated in olden times compared with what they are to-day.

Undoubtedly the metal workers spoken of in the Scriptures and in other ancient histories were founders in the same sense as the term "founder" is used to-day, notably they melted their metal and poured it into molds rather than forging it into the required shape. Wrought iron, which is to say, "worked iron," is the product of later ages and is of comparatively modern origin.

Goldsmiths, silversmiths, coppersmiths, etc., were of necessity melters of these metals, so likewise were all the workers in metals of any kind, all of whom bore the name of "smith." The esteem in which the metal-"smiths" were held and the extent to which the trade was practised may be judged by the extent to which the name smith has been perpetuated. The smiths of ancient days were of no greater necessity than the molders and founders (as they are now known) are to-day, and if they are not now held in the same esteem as formerly the fault rests entirely with themselves, and the object of this letter is to interest, not only the managers of foundries, but those who are employed therein, either as practical molders or helpers, or in any way connected with the foundry.

Some of the Old Methods

Of the methods employed by the ancient smiths, or the shop equipment at their disposal we have very little knowledge, but the Egyptian wall painting shown in the engraving in the heading probably gives as reliable an idea as can be found. The fire was built in a slightly depressed place in the ground; a forced draft was given to the fires by an attendant on either side, who worked the bellows which were placed on the ground in such a manner that they would blow the fire. The attendants worked the bellows by standing on them and alternately throwing their weight from one foot to the other and pulling up the bellows with a rope as the weight was relieved, thus permitting the instruments to be filled and emptied alternately. The little figure opposite the smith's head was probably for fuel or water.

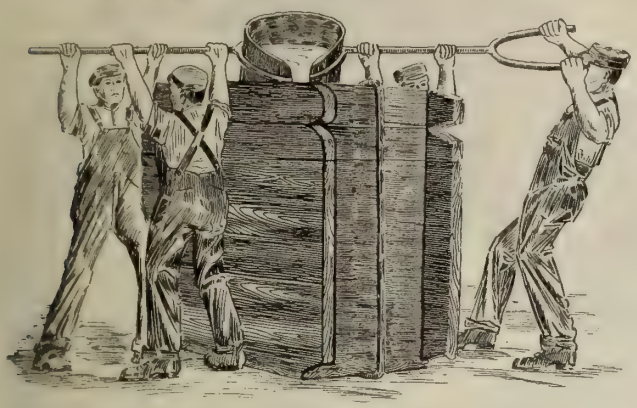
The smiths of those days, no doubt, worked hard and became tired, but the work was likely done out-of-doors, and the men would work up healthy appetites and restful sleep. The present-day molders are placed in a different position and should be treated with even more consideration.

The Molder of To-Day

As things are now, to be a first-class molder and founder is an accomplishment which, as has been frequently pointed out, calls for several distinct characteristics in the makeup of the man. He must be physically able-bodied and muscular, otherwise the work will be a lifelong drag. He must, like all other craftsmen, be mechanically inclined, else he will never be able to comprehend the "why and wherefore" of the different traits or features of his trade. He must be artistically inclined, otherwise he will not be able to make such jobs as have to be done without a perfect pattern, and if his aim is to be a top-notcher, capable of taking charge, he must be in the scientific class in order to master the intricacies of the furnace in the melting of his metals.

To secure boys who will ultimately emerge from their apprenticeship with all of these natural propensities properly developed and with a will to enter upon life's journey in the foundry, the foundryman must realize that he has on his hands a problem which will be hard to solve unless he makes the environments of the foundry such as will attract the proper class of boys. It cannot be expected

that in this 20th century, when so many opportunities are offered to the youth of our country that young men and boys can be found who will voluntarily tolerate a life such as the molders of the immediate past were wont



HOW HIGH MOLDS ARE USUALLY POURED.

to endure. The requirements of the present and the future are that the foundry must be kept up to the same standard as other industrial institutions both as regards healthy surroundings and labor-saving equipment.

The Place of Machinery

The expression "labor-saving" can be translated into two different conceptions. The one is to utilize machinery to replace the man wherever an opportunity offers, while the other is to make the necessary labor of the man the least laborious possible. The first conception is usually adopted by the modern foundryman while the latter is

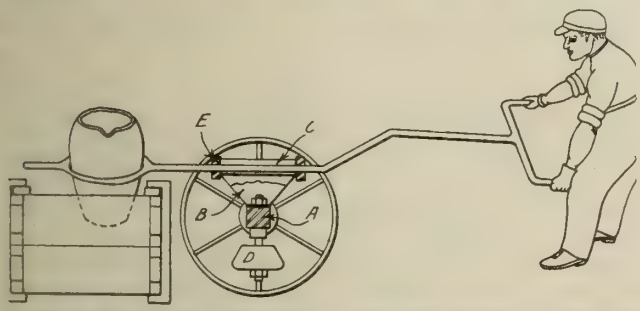


FIG. SHOWING SUPPLY LADLE ARRANGEMENT. A IS THE AXLE. B IS SUPPORT FOR SHANKS. C IS SLAT IN WHICH SHANK RESTS. D IS WEIGHT TO KEEP B IN PROPER POSITION. E IS COLLAR TO KEEP LADLE IN PROPER LOCATION.

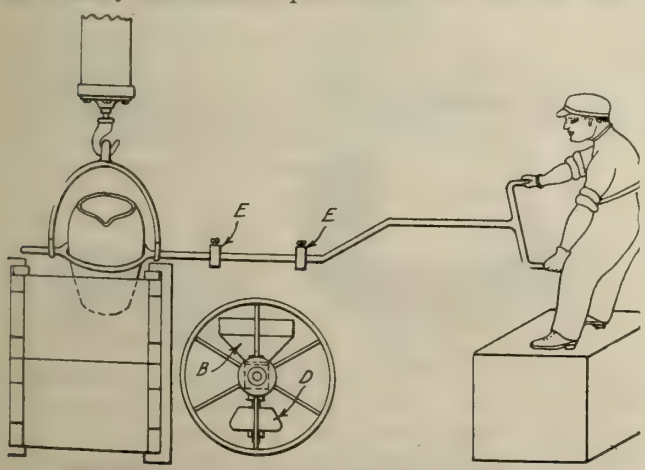
seldom considered. There are many improvements which could be introduced into the foundry to make it more attractive, and now that the reconstruction period is at hand and the world must needs be run on a different basis, the foundry must take its place with the others and wake

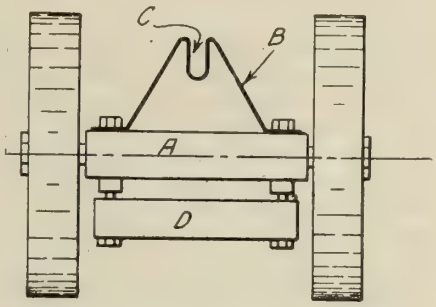


SHOWING LADLE HOISTED TO POUR HIGH MOLD.

up. Labor-saving appliances which will increase the output of each man will, of course, always be in order but the desire of the writer is to inspire interest in the installation of labor-saving devices for the saving of the labor exacted from each man. Perhaps a few illustrations of what molders have to endure would make more clear the need for improvements.

Things That Should Not Be

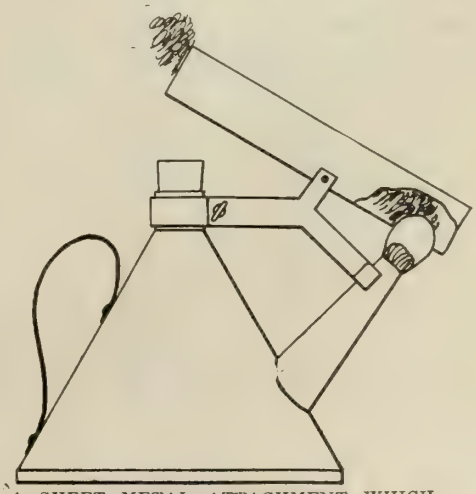
In Fig. 2 will be seen a common way of pouring a high mold. A cable hanging over a grooved pulley attached to the roof would be an improvement to this, but inexpensive pouring devices are on the market which can be used on jobs such as this or they can be used for pouring snap molds. Sulky ladles similar to Fig. 3 are in use in a limited number of places, but should be more generally used. They are so arranged that they can be used in pouring molds of from a few inches high up to 18 or 20 inches, or they can be lifted from the wheels by any kind of a device and used for pouring very high molds. In Fig. 4 is a sample of what the molder



SHOWING END VIEW OF DETAILS.

has to put up with in many a foundry. These foundry torches are actually on the market for molders' use. They consist of an iron oil can with a wick made of several strands of candle wicking shoved down into the spout, a bon-fire is lit on the end which sticks out, and as it burns away it is pulled up with the assistance of a nail.

Pages might be written on what could be done to ease the molder's burden, but the molder can do his



A SHEET METAL ATTACHMENT WHICH WOULD CARRY AWAY THE SMOKE.

share of work if the shop is made fit to work in. "Cleanliness is next to Godliness" and it is as easily accomplished in the foundry as in the office. The first thing to do is to clean it up, after which keep it clean. Wash the windows and keep them washed. Repair the broken windows and the misfitting doors and keep them repaired, and put in a proper heating and ventilating system.

In Fig. 5 will be seen a ventilator such as can be used

in the gable. These ventilators are used in rubber factories, tanneries, soap factories and kindred places for the purpose of carrying off foul smells, and if used in the foundry would carry away the gas and smoke and dust, so that the men could work in comfort, and also that the shop would fill up with fresh aid which could be properly heated. If a little more consideration were given to the systematizing of the working programme it would be quite possible to make it pleasant for everyone concerned.

No molder should ever be allowed to shake out or cut over sand heaps. This does not mean that he is handing over the hard work to some less fortunate person. It simply means that if a fresh man with a dry shirt comes into the shop after the molders are gone he can open all the doors and windows and start the rotary ventilator and suck all the steam and dust out of the shop. This will not do him any harm because he has not been sweating and he is amply working as though out of doors.

Once the foundryman awakens to the need of labor-saving devices not only to take the place of the men he dispensed with but also of labor-saving and health-saving devices for the ones he retains, he will have no further need of fear regarding his future supply of molders. Even though the molding machine became so perfected that a common laborer could do certain jobs, it must be borne in mind that the commonest kind of a common laborer is generally pretty hard pressed for employment when he hits the foundry, but

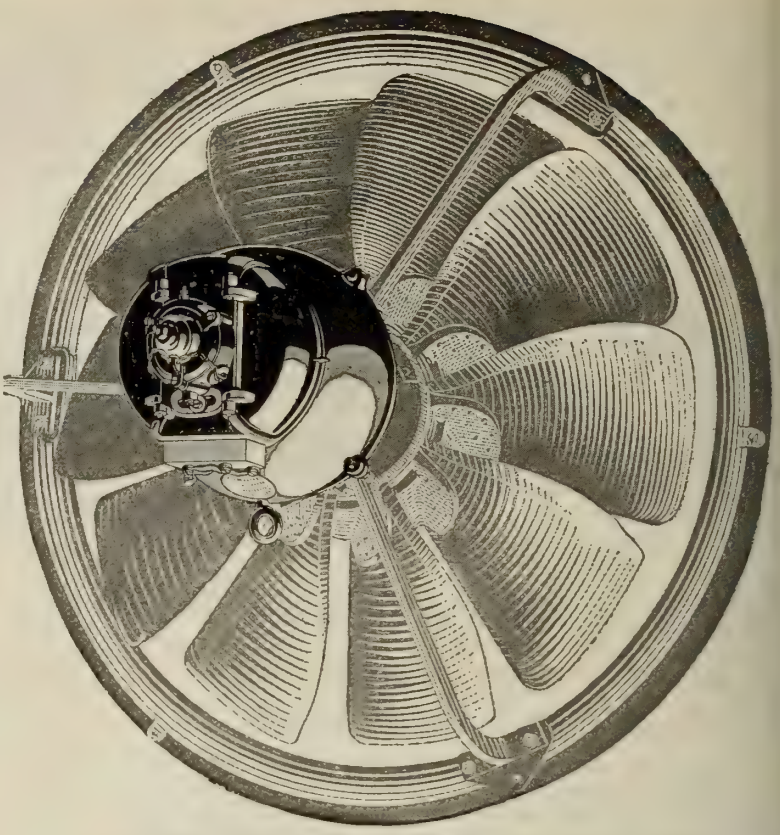


FIG. 5—TYPE OF VENTILATOR THAT WOULD MAKE BETTER CONDITIONS IN THE FOUNDRY.

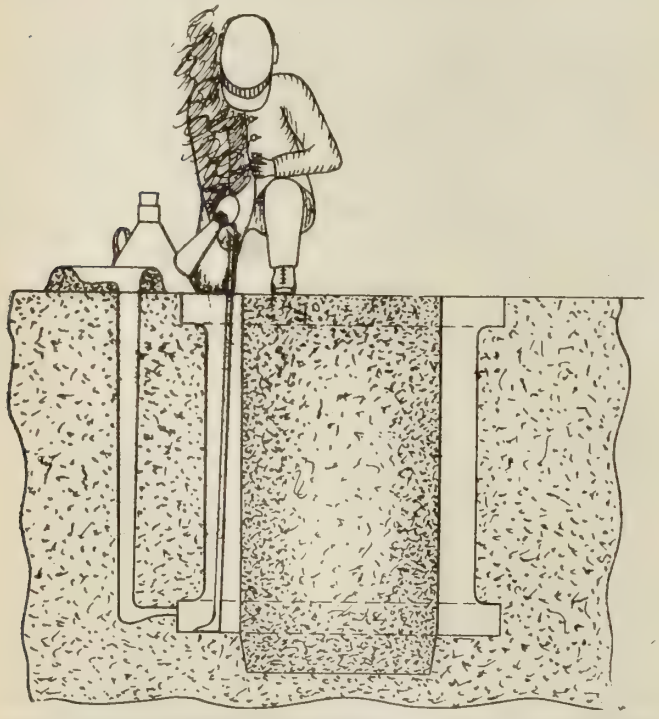

THE USUAL METHOD OF LIGHTING A DEEP MOLD. THE FUMES FROM THE OIL LAMP ALL COME UP IN THE MOLDER'S FACE.

there is certainly no excuse for this state of affairs as foundry work is one of the noblest and most interesting of occupations.

A cubic inch of solid coal has a superficial area of 6 sq. in.—but the combined area of an equal weight of pulverized coal is over 30 sq. ft. or an increase in area of approximately 700 times.

It often happens that some obstruction prevents the turning of a monkey wrench though the jaws fit the nut. A novel form of adjustable wrench has its head pivoted in the handle, with a ratchet connection. This not only allows the tool to be used at eight different angles, but makes effective even a very limited movement of the handle. The ratchet, which works either way, is locked or released by pressing on a small dog located where the user's thumb naturally rests.

—"Evening News" (London).

SHE'S SORRY NOW SHE PATTED IT.

Holland is finding it is easier said than done to get rid of the ex-Kaiser.

Do You Know Exactly What Your Product Costs?

Suppose You Were Asked the Question Stated Above, Could You in All Honesty State a Definite Figure Showing Your Loss or Gain? If You Cannot, There is Something Wrong

IT is not the writer's intention to carry readers through a long-winded dissertation on production figures, nor does he intend going into any elaborate system of keeping track of such costs, but it is his intention and purpose to place before readers in as concise a manner as possible a series of graphical solutions to the cost problem.

Before touching on these graphs, however, let us consider for a moment what we mean when we speak of the cost of a product.

The essential aim and incentive of all manufacturers is to turn out their product at the greatest possible profit. This, of course, is exactly as it should be, but once more let us consider just what the word PROFIT means.

In the writer's opinion it is the difference between the selling price and the manufacturing cost of the article, irrespective of the nature of the article. The selling price in turn is based on the production cost, therefore to sell intelligently one must know thoroughly and accurately the cost of manufacture.

There are, however, some executives still left who stick to the old rule-of-thumb method, namely, to sell their product at some certain price, simply because their competitor does so, or worse still, to sell just a little lower than their competitor, with the idea of grabbing up all the orders.

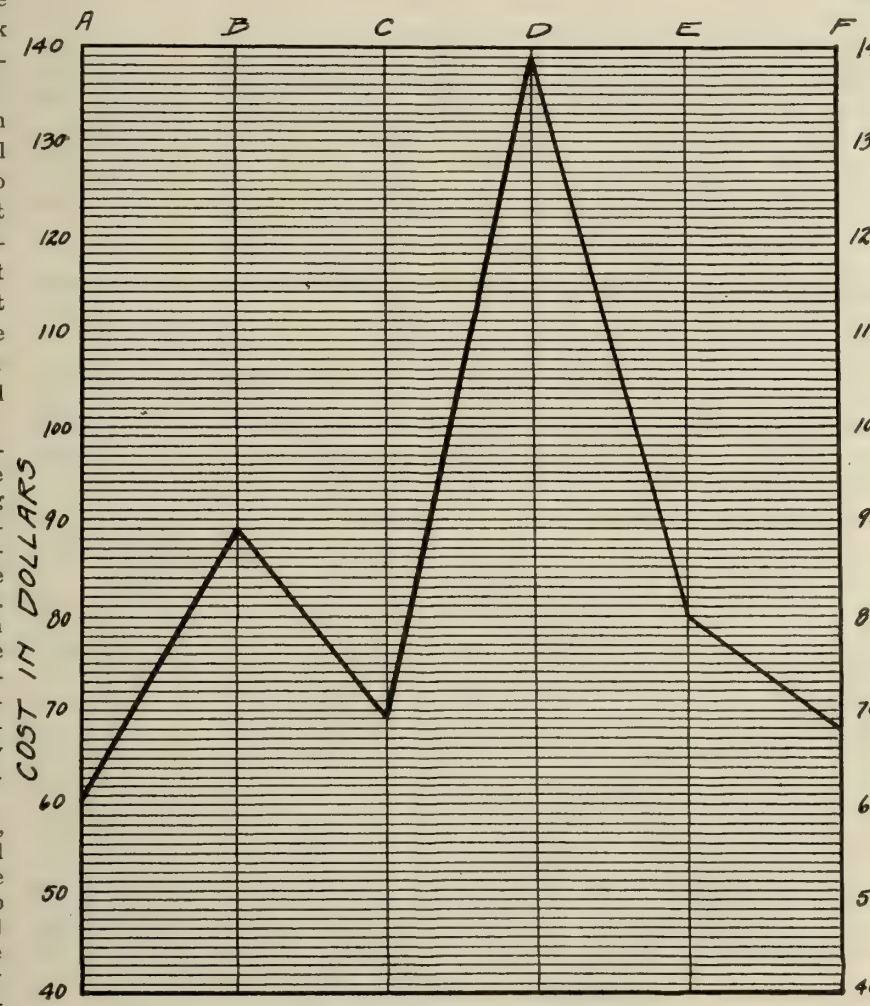

FIG. 1.—ILLUSTRATING HOW THE PLANING COSTS SHOWED UP.

The worst feature of all is that this method is usually adopted without any certain knowledge of costs. True they may assume certain factors, but they have no proven facts to set their prices from.

The chief reason for this pitfall existing, is the fact that the importance of a proper cost system is seldom properly realized in any plant. However, the day of watching the production cost is dawning, for interest is awakening as never before. Everywhere cost systems are being installed, and to-day there are few executives who do not at least possess the desire for a common-sense cost system. The chief trouble, however, seems to be in judging what a cost system really is.

The Fear of Red Tape

Often the fear of red tape, and the expense of maintaining it, deter too many from obtaining the goal of their desire. It is this very fact that accounts for so many unfinished, half-hearted attempts at cost systematizing at the present time.

There is no need of such a condition, for an effective and proven cost system can be easily maintained, if properly introduced. The clerical costs need not be high.

From this the writer does not infer that you hire cheap help, for such an idea is suicide to any cost system. Above all, secure competent men to handle your system, but watch that your system is kept within reasonable limits, and not made up of useless red tape. It is this dividing line which defines the real useful cost scheme from the elaborate, one method to cover all ideas.

There never was, and never will be one system to cover all branches of the trade, for each business has certain operations, and peculiarities, which must be met with, but from their own particular standpoint and angle.

No matter what the business, however, the executive sitting in his office examining the cost charts, should be able to visualize the shop conditions which they refer to, not alone the machines, but the men, the operations, and the materials, etc.

In this way loss of labor, careless expenditures, waste of material, poor equipment, losses of profit, and other matters, are brought clearly before the executive's eyes. Without a good cost system these matters would often take a long time indeed before cropping up for attention.

To get the very best value from any cost system we must first have a practical knowledge of the product, and its procedure of manufacture. The price of material, shop conditions, etc., must all

be thoroughly gone into, before attempting to start a rational method of keeping track of the work.

When a cost system is finally in operation, there is one essential to its success, and effectiveness, which is too seldom considered, namely, co-operation of the executive organization.

One Man Control Impossible

In a plant of any size it is impossible for one man to keep under his control all decision and action. He must gradually allow his subordinates to perform certain duties, as they show ability, which is only as it should be, for in this way each member will take a personal interest in the system's success.

There has been many a good system thrown into the discard through lack of co-operation.

Another evil which has caused the downfall of many a good cost system is that of impatience. By this the writer means impatience for results. Rome was not built in a day, we are told. Therefore it stands to reason that the same principle holds good for a cost system. Suppose, for instance, we take two plants, the first of which, although it adopted no cost system, still tried as much as possible to run on a systematic basis, the second never believed in cost systems, and what was more, believed any sort of system pure bunkum.

Which plant would show the quickest results providing a cost system was adopted?

Naturally, readers will say the first, because this shop was at least partly systematized, yet there are some people who would claim that each should show equally prompt results.
